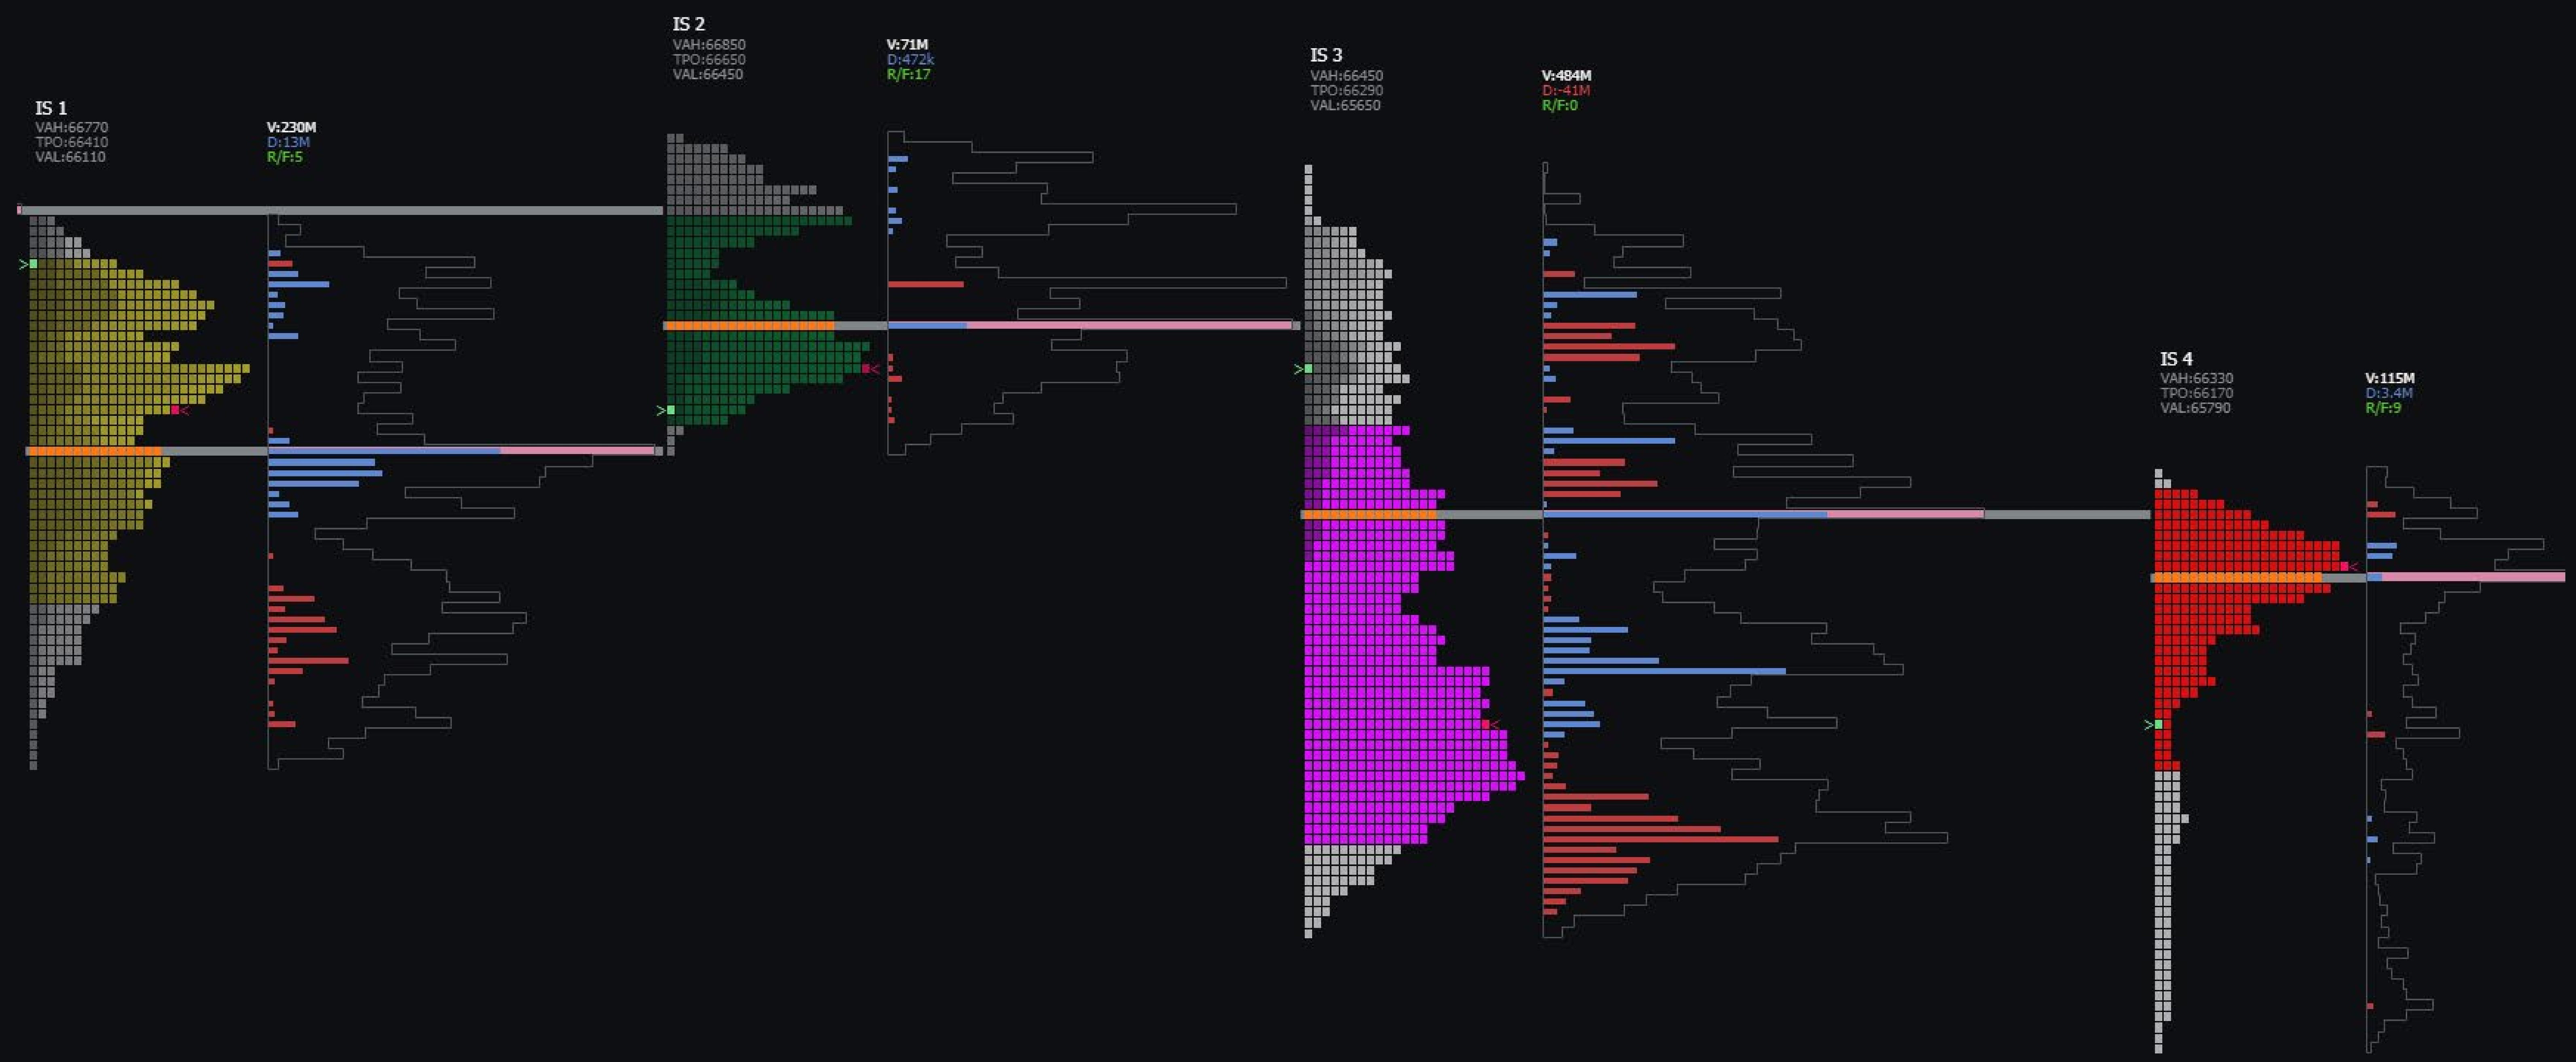
Igor Sessions

The Igor Sessions are similar to TPO Charts and based on the Igor Time theory. One TPO Daily Session is split into 4 Igor Sessions as per the example below

Igor Session 1: Yellow
Igor Session 2: Green
Igor Session 3: Purple
Igor Session 4: Red

TPO Series module: Part 11. Igor Session (6:19)

They are used by day traders in a low term time frame. Igor Sessions are based on Igor Times.



We use the nsPOC (Naked Session Point of Control) from the previous sessions to trade.

We need Order Flow software such as ATAS or ExoCharts to use the Igor Session template

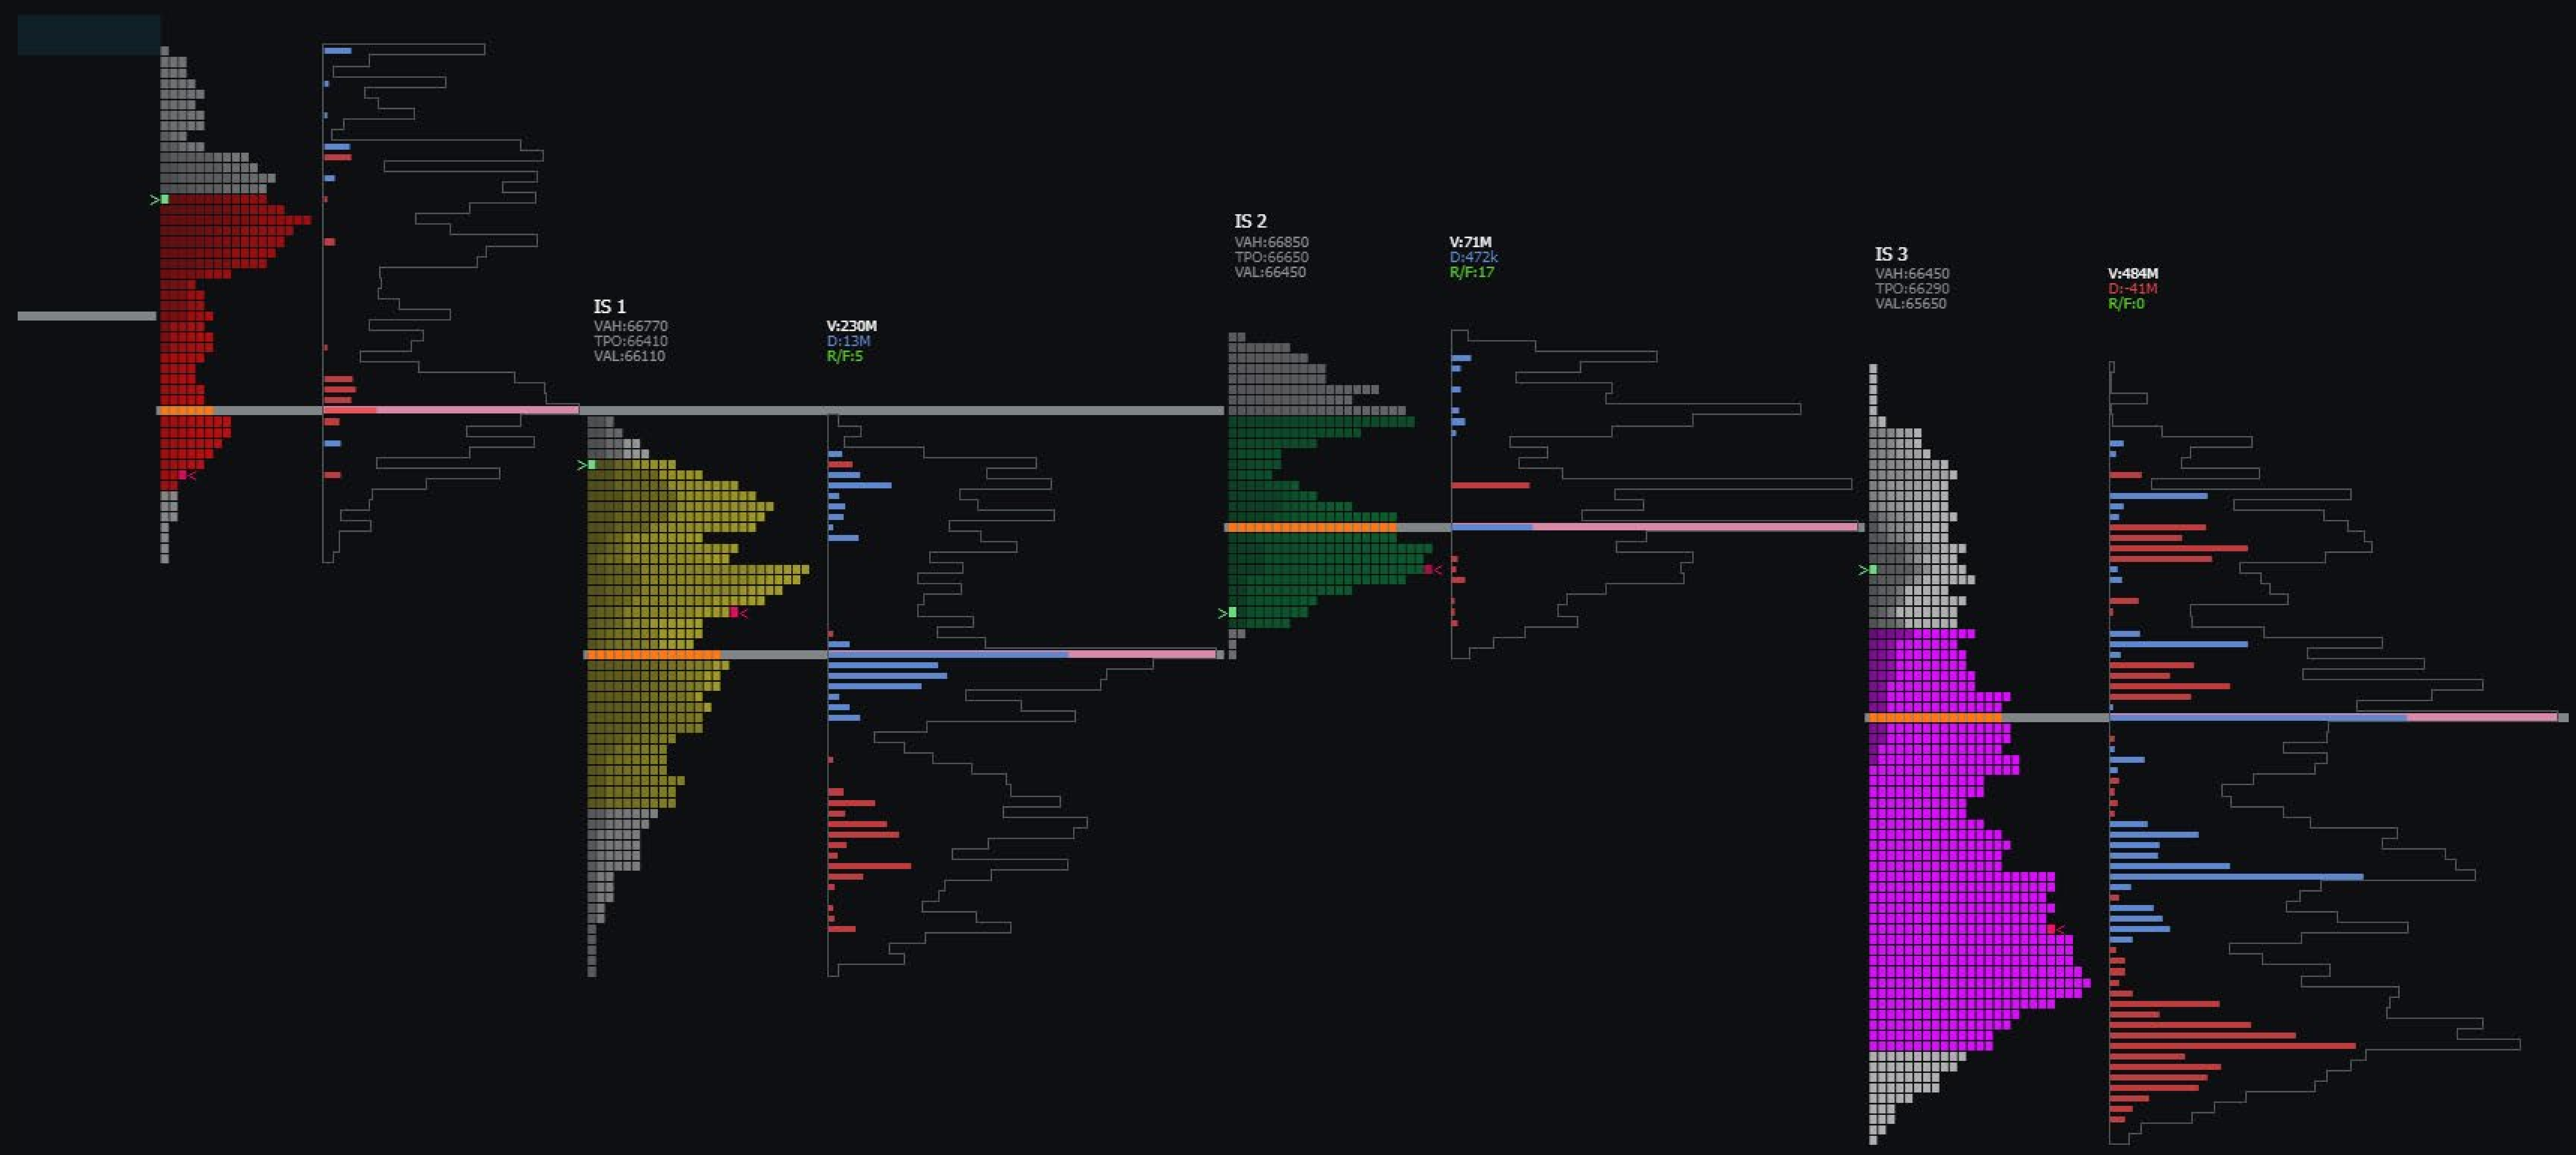
The importance of confluences

We have a high probability trade when we find strong confluence with the nsPOC from previous sessions. We do not trade a nsPOC alone.

We can use the CC Retracement, VWAP, Horizontal levels, and SFP Setups as strong confluences.

TPO Series module: Part 11. Igor Session (9:42)

In this example, we can see the nsPOC of previous sessions aligning with the CC Retracement, providing a good short opportunity.



Merging Igor Sessions Profile

Naked Sessions Point of Control Overlapping each other:

We only merge Igor Sessions when the nsPOCs overlap each other to get one profile with a strong nPOC level.

TPO Series module: Part 11. Igor Session (23:50)

Merging Igor Sessions Profile

Igor Sessions merged

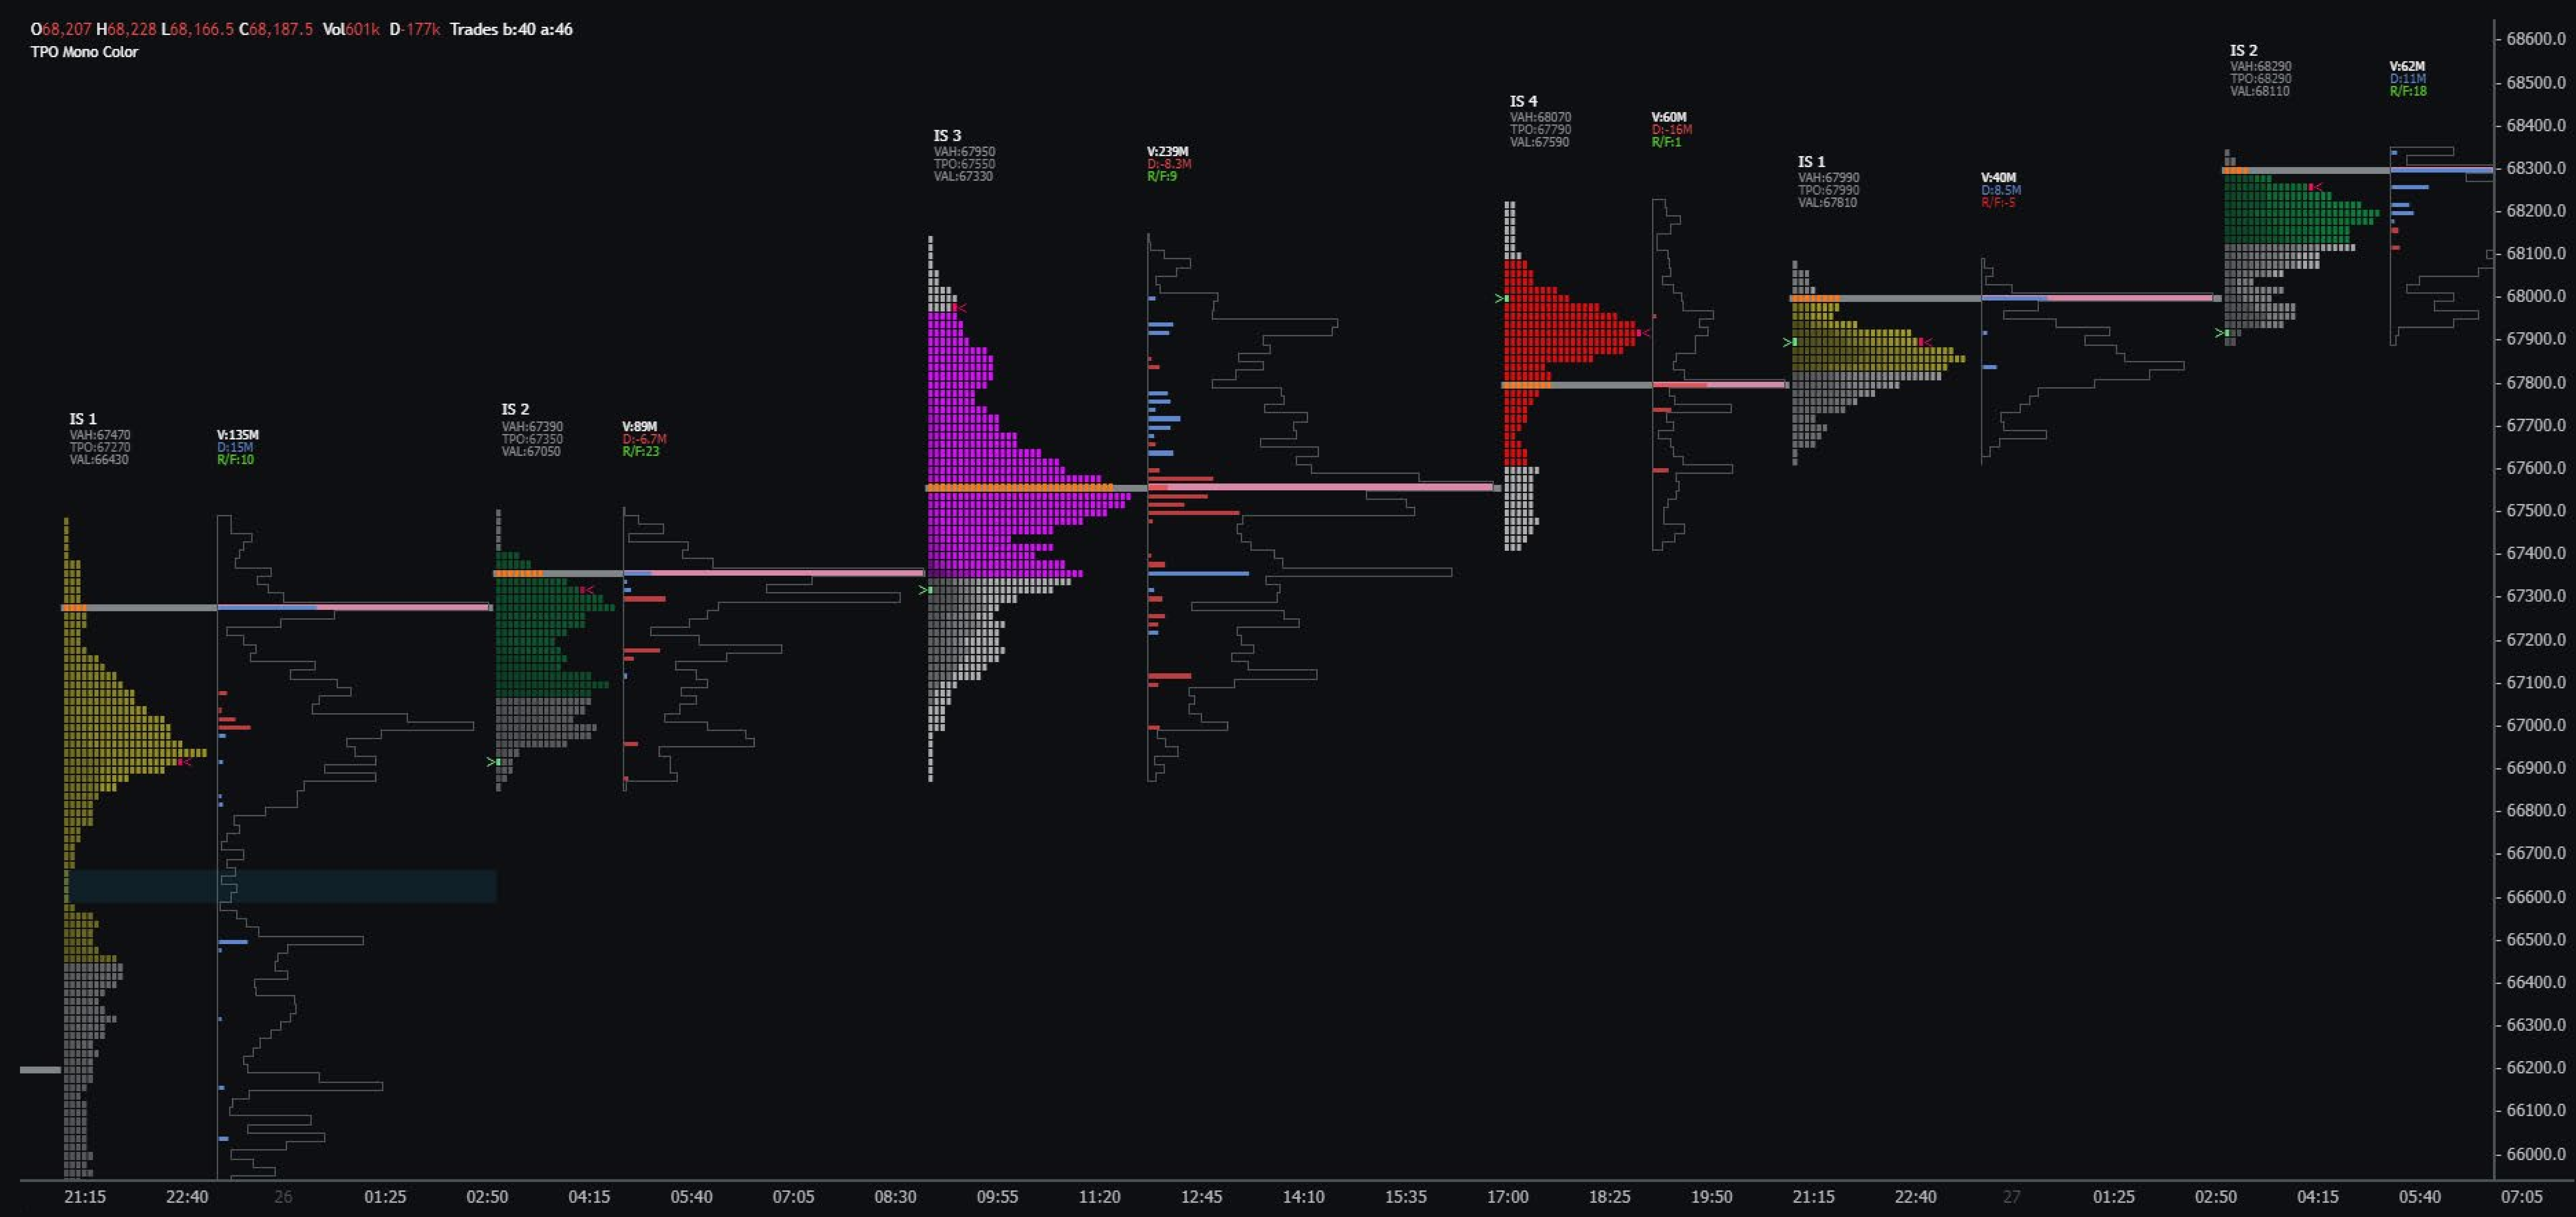
Here is an example of those Igor sessions merged.

TPO Series module: Part 11. Igor Session (23:50)

Identifying a trending day

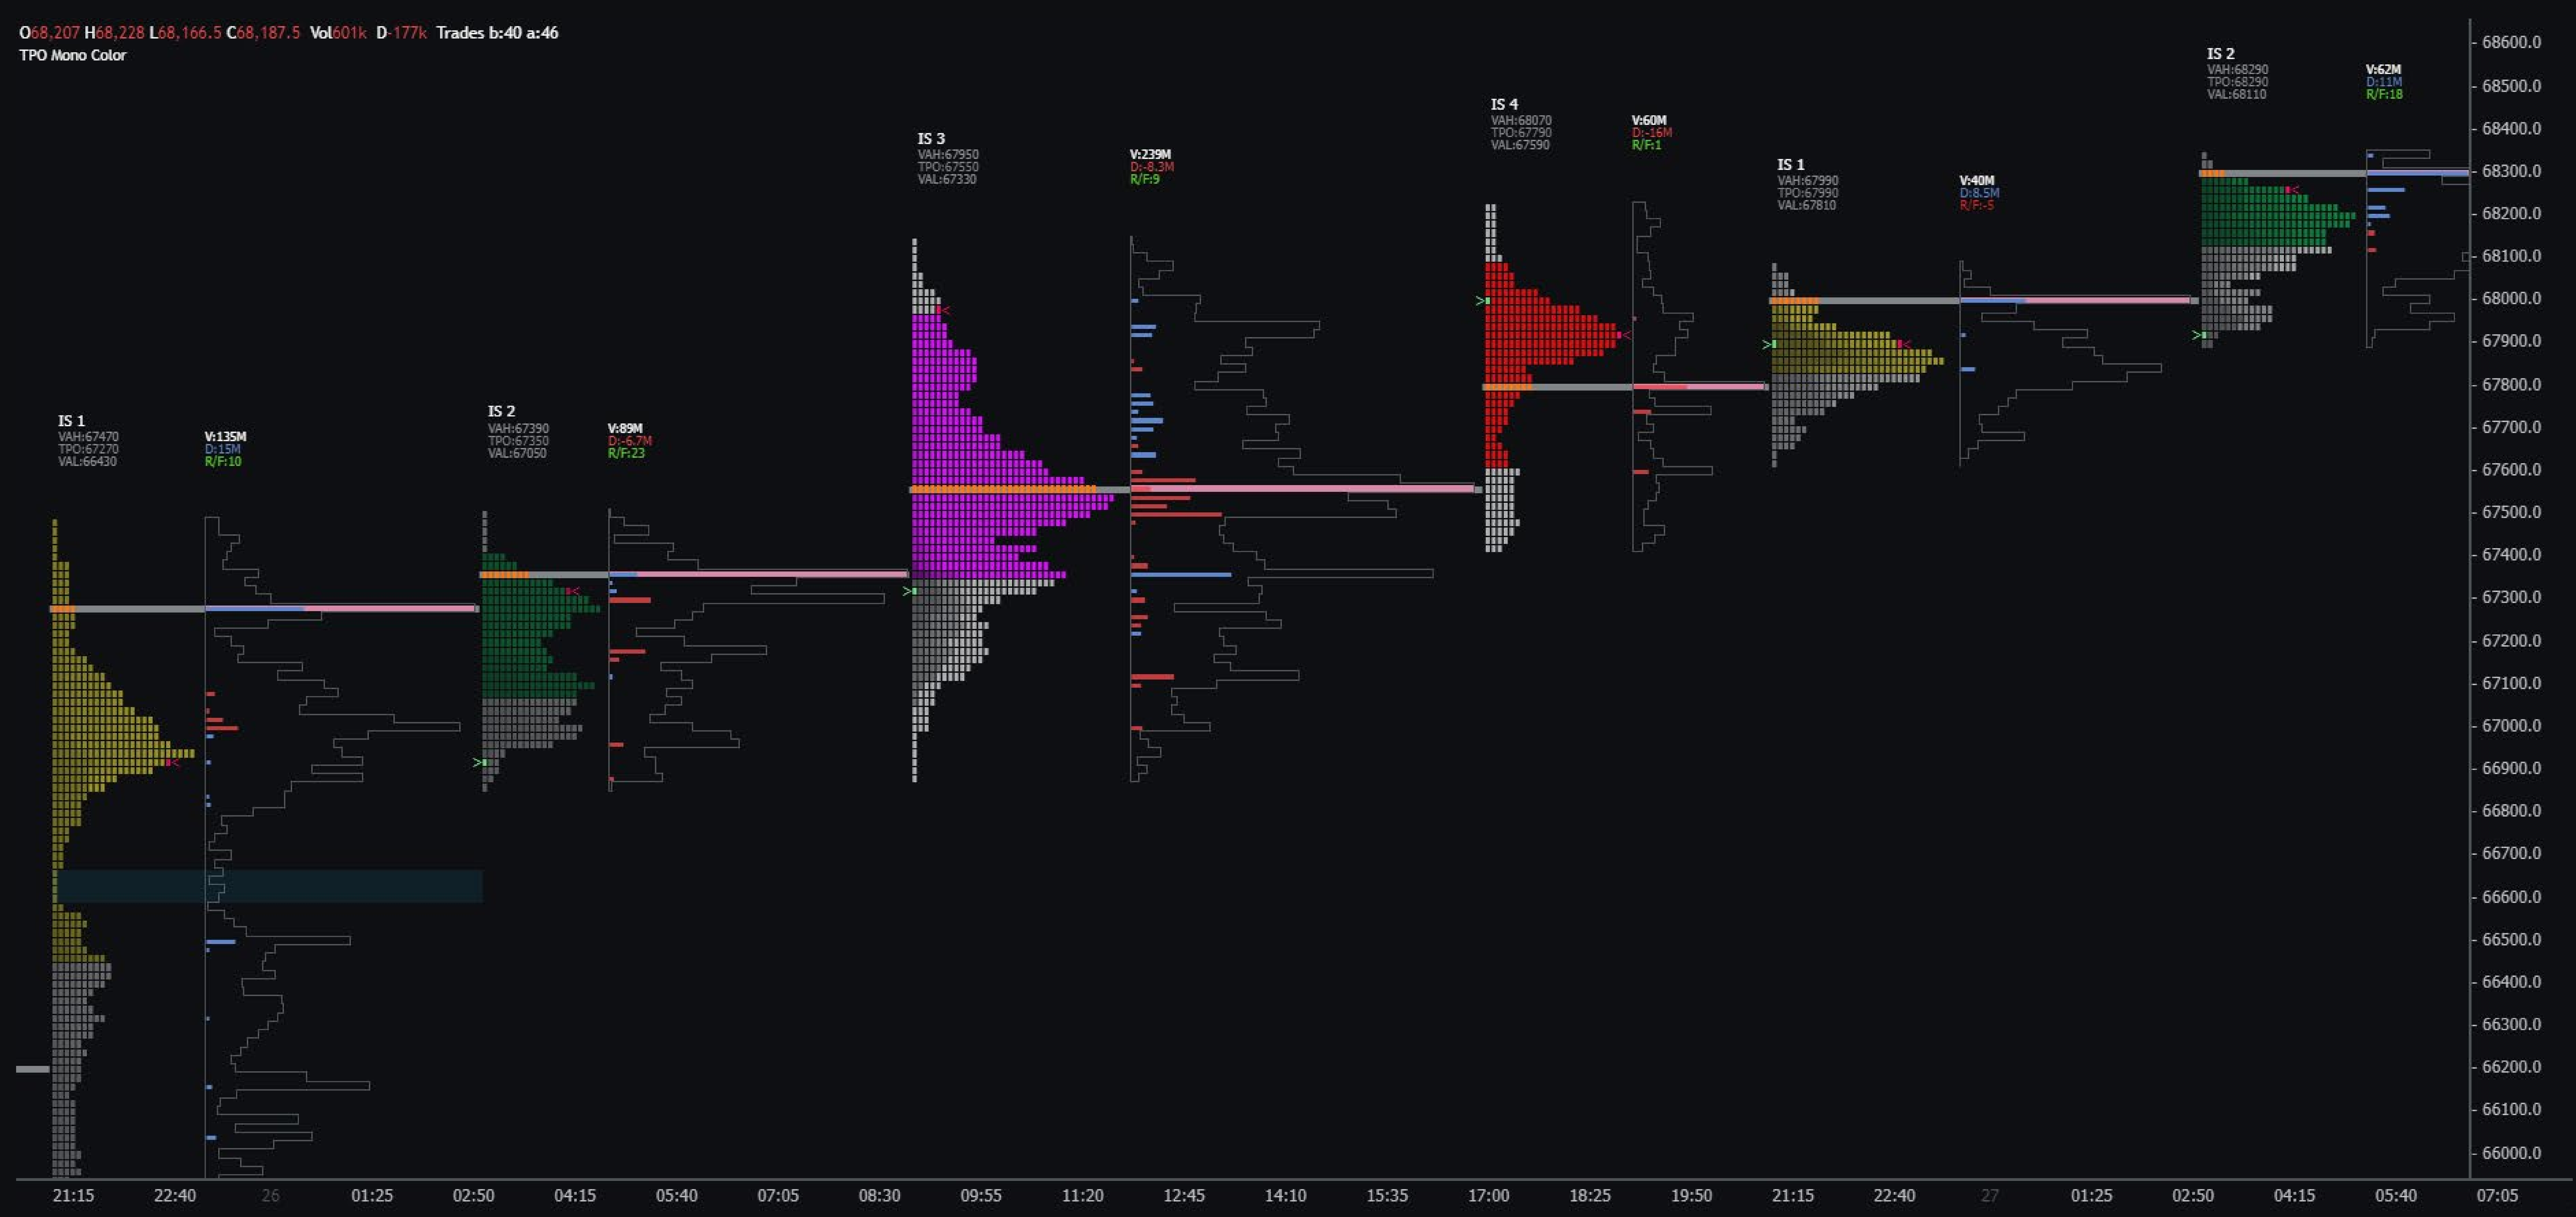
On a trending day, we should see the nsPOC moving up and acting as support for the following session.

TPO Series module: Part 11. Igor Session (25:27)



When the nsPOC from the previous session is lost, it is a good sign that the trending day is over. The price is likely to either consolidate or retrace lower.

Igor Time



Igor Times are different from the standard London, New York and Asia market open times.

Igor Times are times during the trading day when significant volatility occurs, through an injection of a high volume into the market. There are 4 Igor Sessions (IS) in a day and they start as follows.

Times in UTC

IS1: 00:00 - 06:00
IS2: 06:00 - 12:00
IS3: 12:00 - 20:00
IS4: 20:00 - 00:00

TPO Series module: Part 12. Igor Time (5:27)

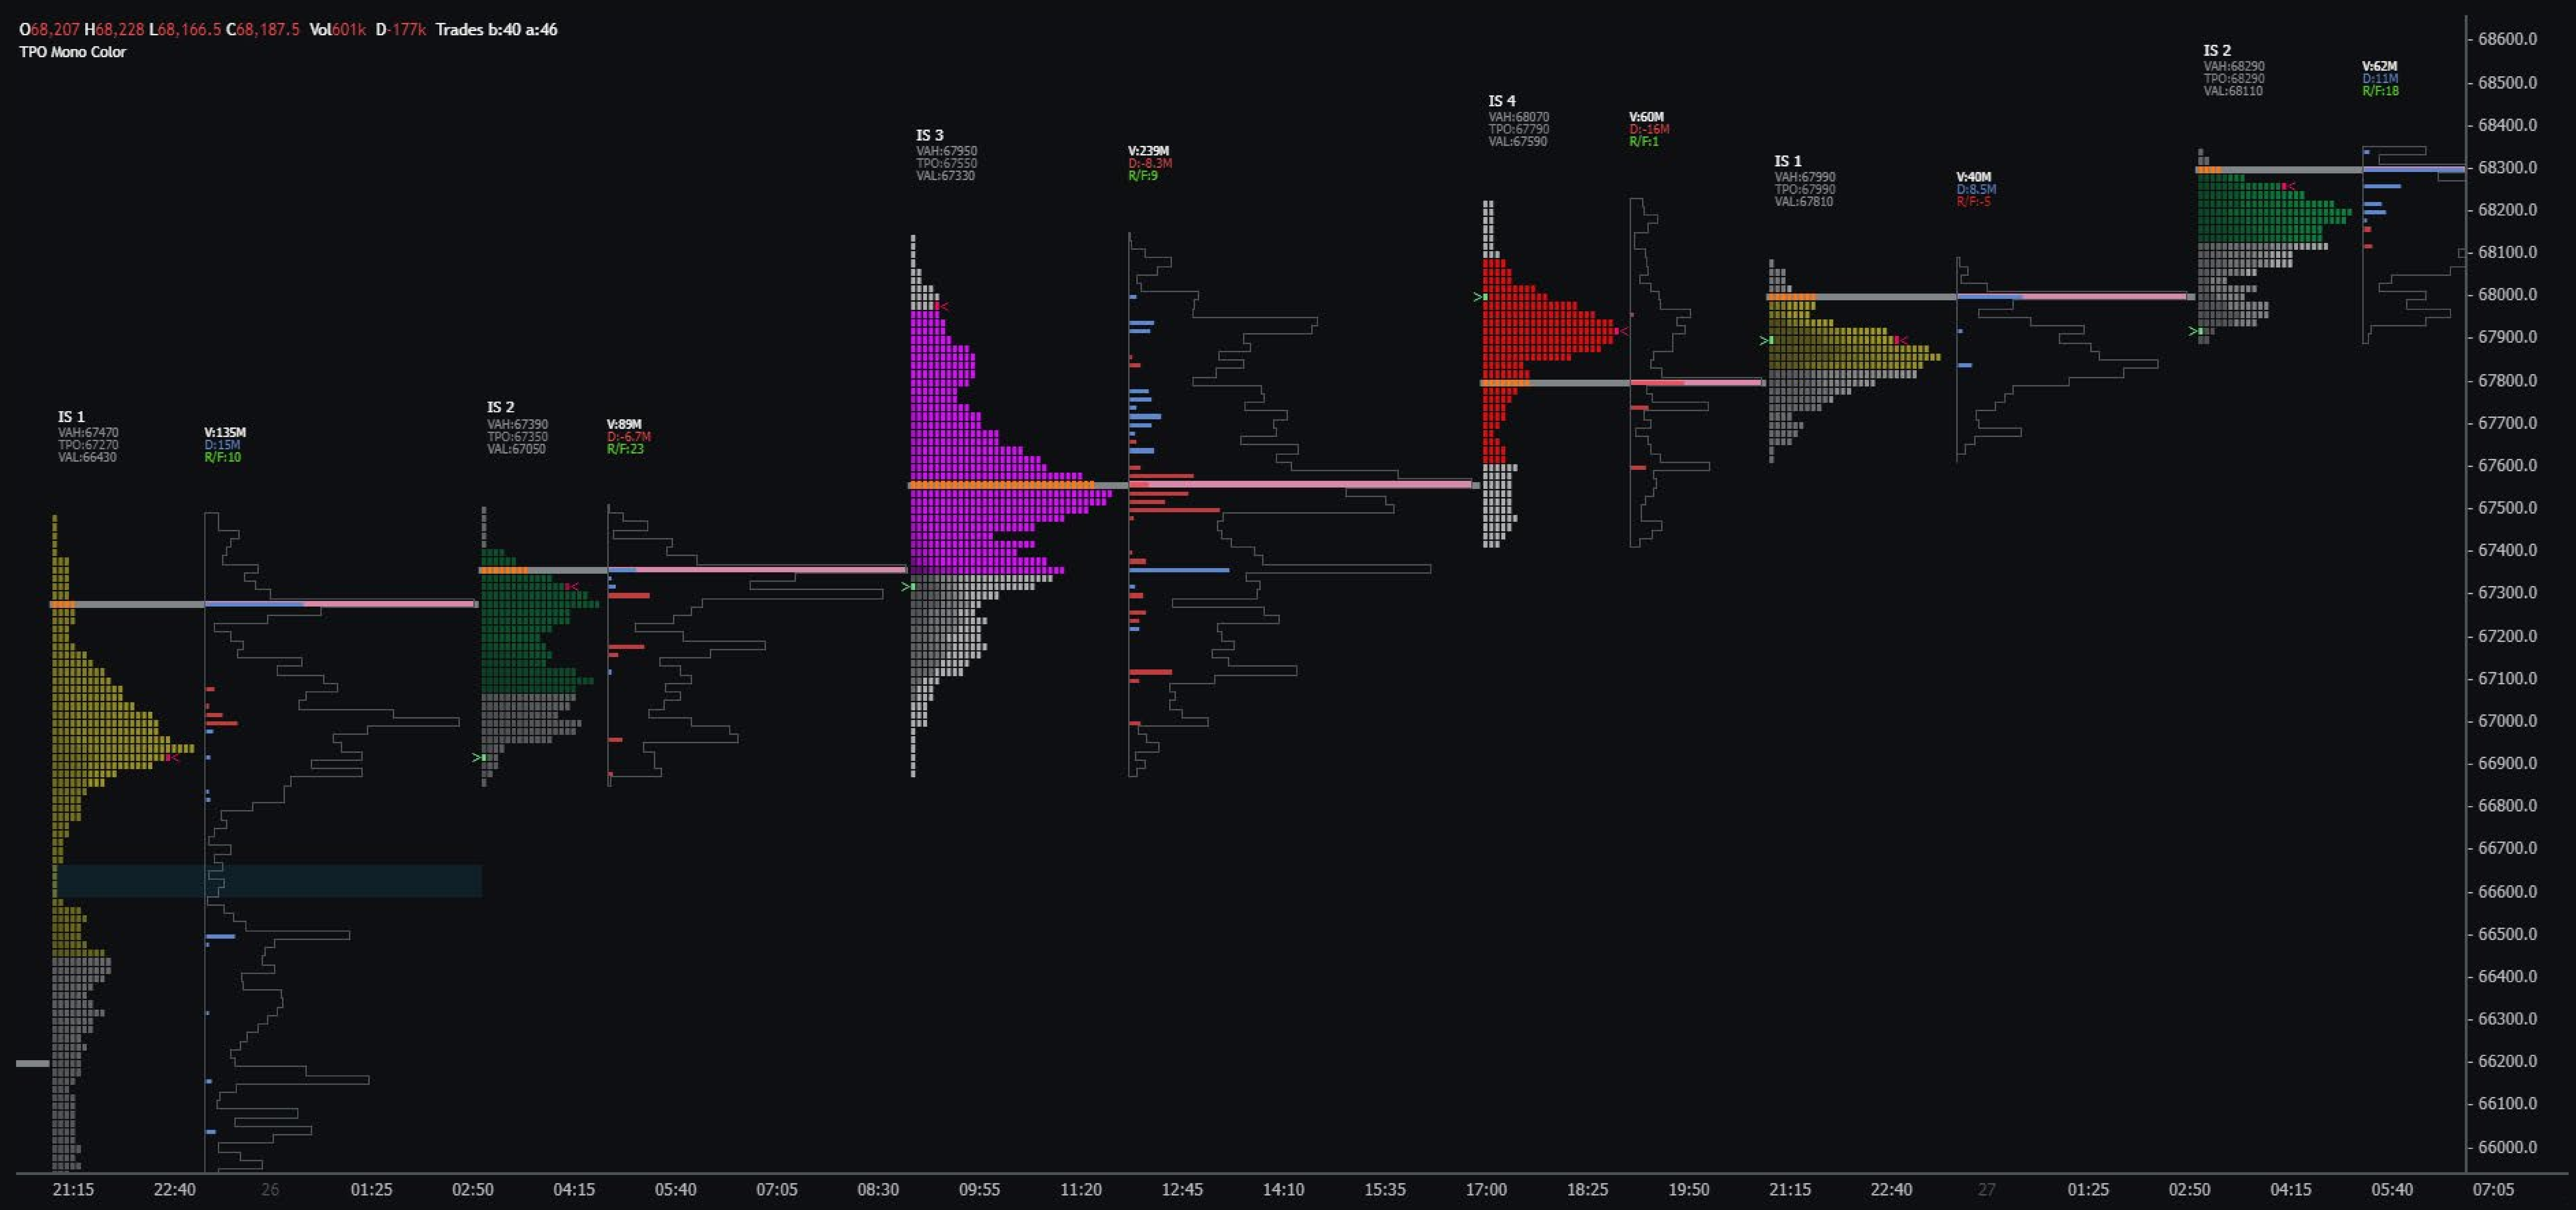
Reading the context on Igor Time

At the start of each Igor Session, we look for a major move in the market or a major key level to be put in.

For example, on IS3 we monitor the price action from 11:50 to 12:30.

In the following example, we can see how the price rejected the IS3 nsPOC as soon as IS4 began, offering a strong rejection and a good short trade opportunity.

TPO Series module: Part 12. Igor Time (7:55)



The most common moves that happen on Igor Time are SFP setups or the start of a major move as volume is injected.

General ranking by Volume, highest to lowest: IS3 > IS2 > IS4 > IS1

Reading the market context helps to determine the likely direction of price movement.

If we can not read the context, simply wait for the move to happen and trade the reaction.

TPO Series module: Part 12. Igor Time (24:10)

Downtrend Example

In the following example, we can see the expanded profiles and a clear downtrend in IS3.

TPO Series module: Part 12. Igor Time (9:18)

During the IS4, an SFP of the IS3 forms, resulting in a trend reversal.

Igor Time and Fibonacci Time

Igor Time is different than Fibonacci Time.

Fibonacci Time is useful to estimate price moves weeks in advance and Igor Time is used for intraday trades.

We can combine them to time a volatile move on a specific Fibonacci time day.

TPO Series module: Part 12. Igor Time (21:09)
