

VWAP & Anchored VWAP

Cheat Sheet

www.chartchampions.com

Volume Weighted Average Price (VWAP) is a dynamic support and resistance line that combines price and volume and can be used on all timeframes.

Above VWAP: it's 'above value' and we expect support.

Below VWAP: it's 'below value' and we expect resistance.

Indicators module: VWAP (7:58)

Here we can see how the Session VWAP acts as a very precise S/R throughout the day.

The Session VWAP is great for scalping and when lining up with other confluences such as Fibonacci, Value Areas or POC can give great trades.

Special note: The New York VWAP is the regular VWAP line from the New York Session, it's a powerful tool when trading futures as this session is where most of the volume is transacted. It can be used the same way as the standard VWAP. To set up the NY VWAP check the Settings section.

Indicators module: VWAP (15:53)

Anchored VWAP

Anchored Volume Weighted Average Price (A-VWAP) is the measure of the average price of an asset for a particular period, starting from a user-selected point.

The starting point would be an important pivot of the chart, generally a major high or low, the start of a trend or a candle where the price breaks out of range.

Tools and Charts module: Anchored VWAP (0.25)

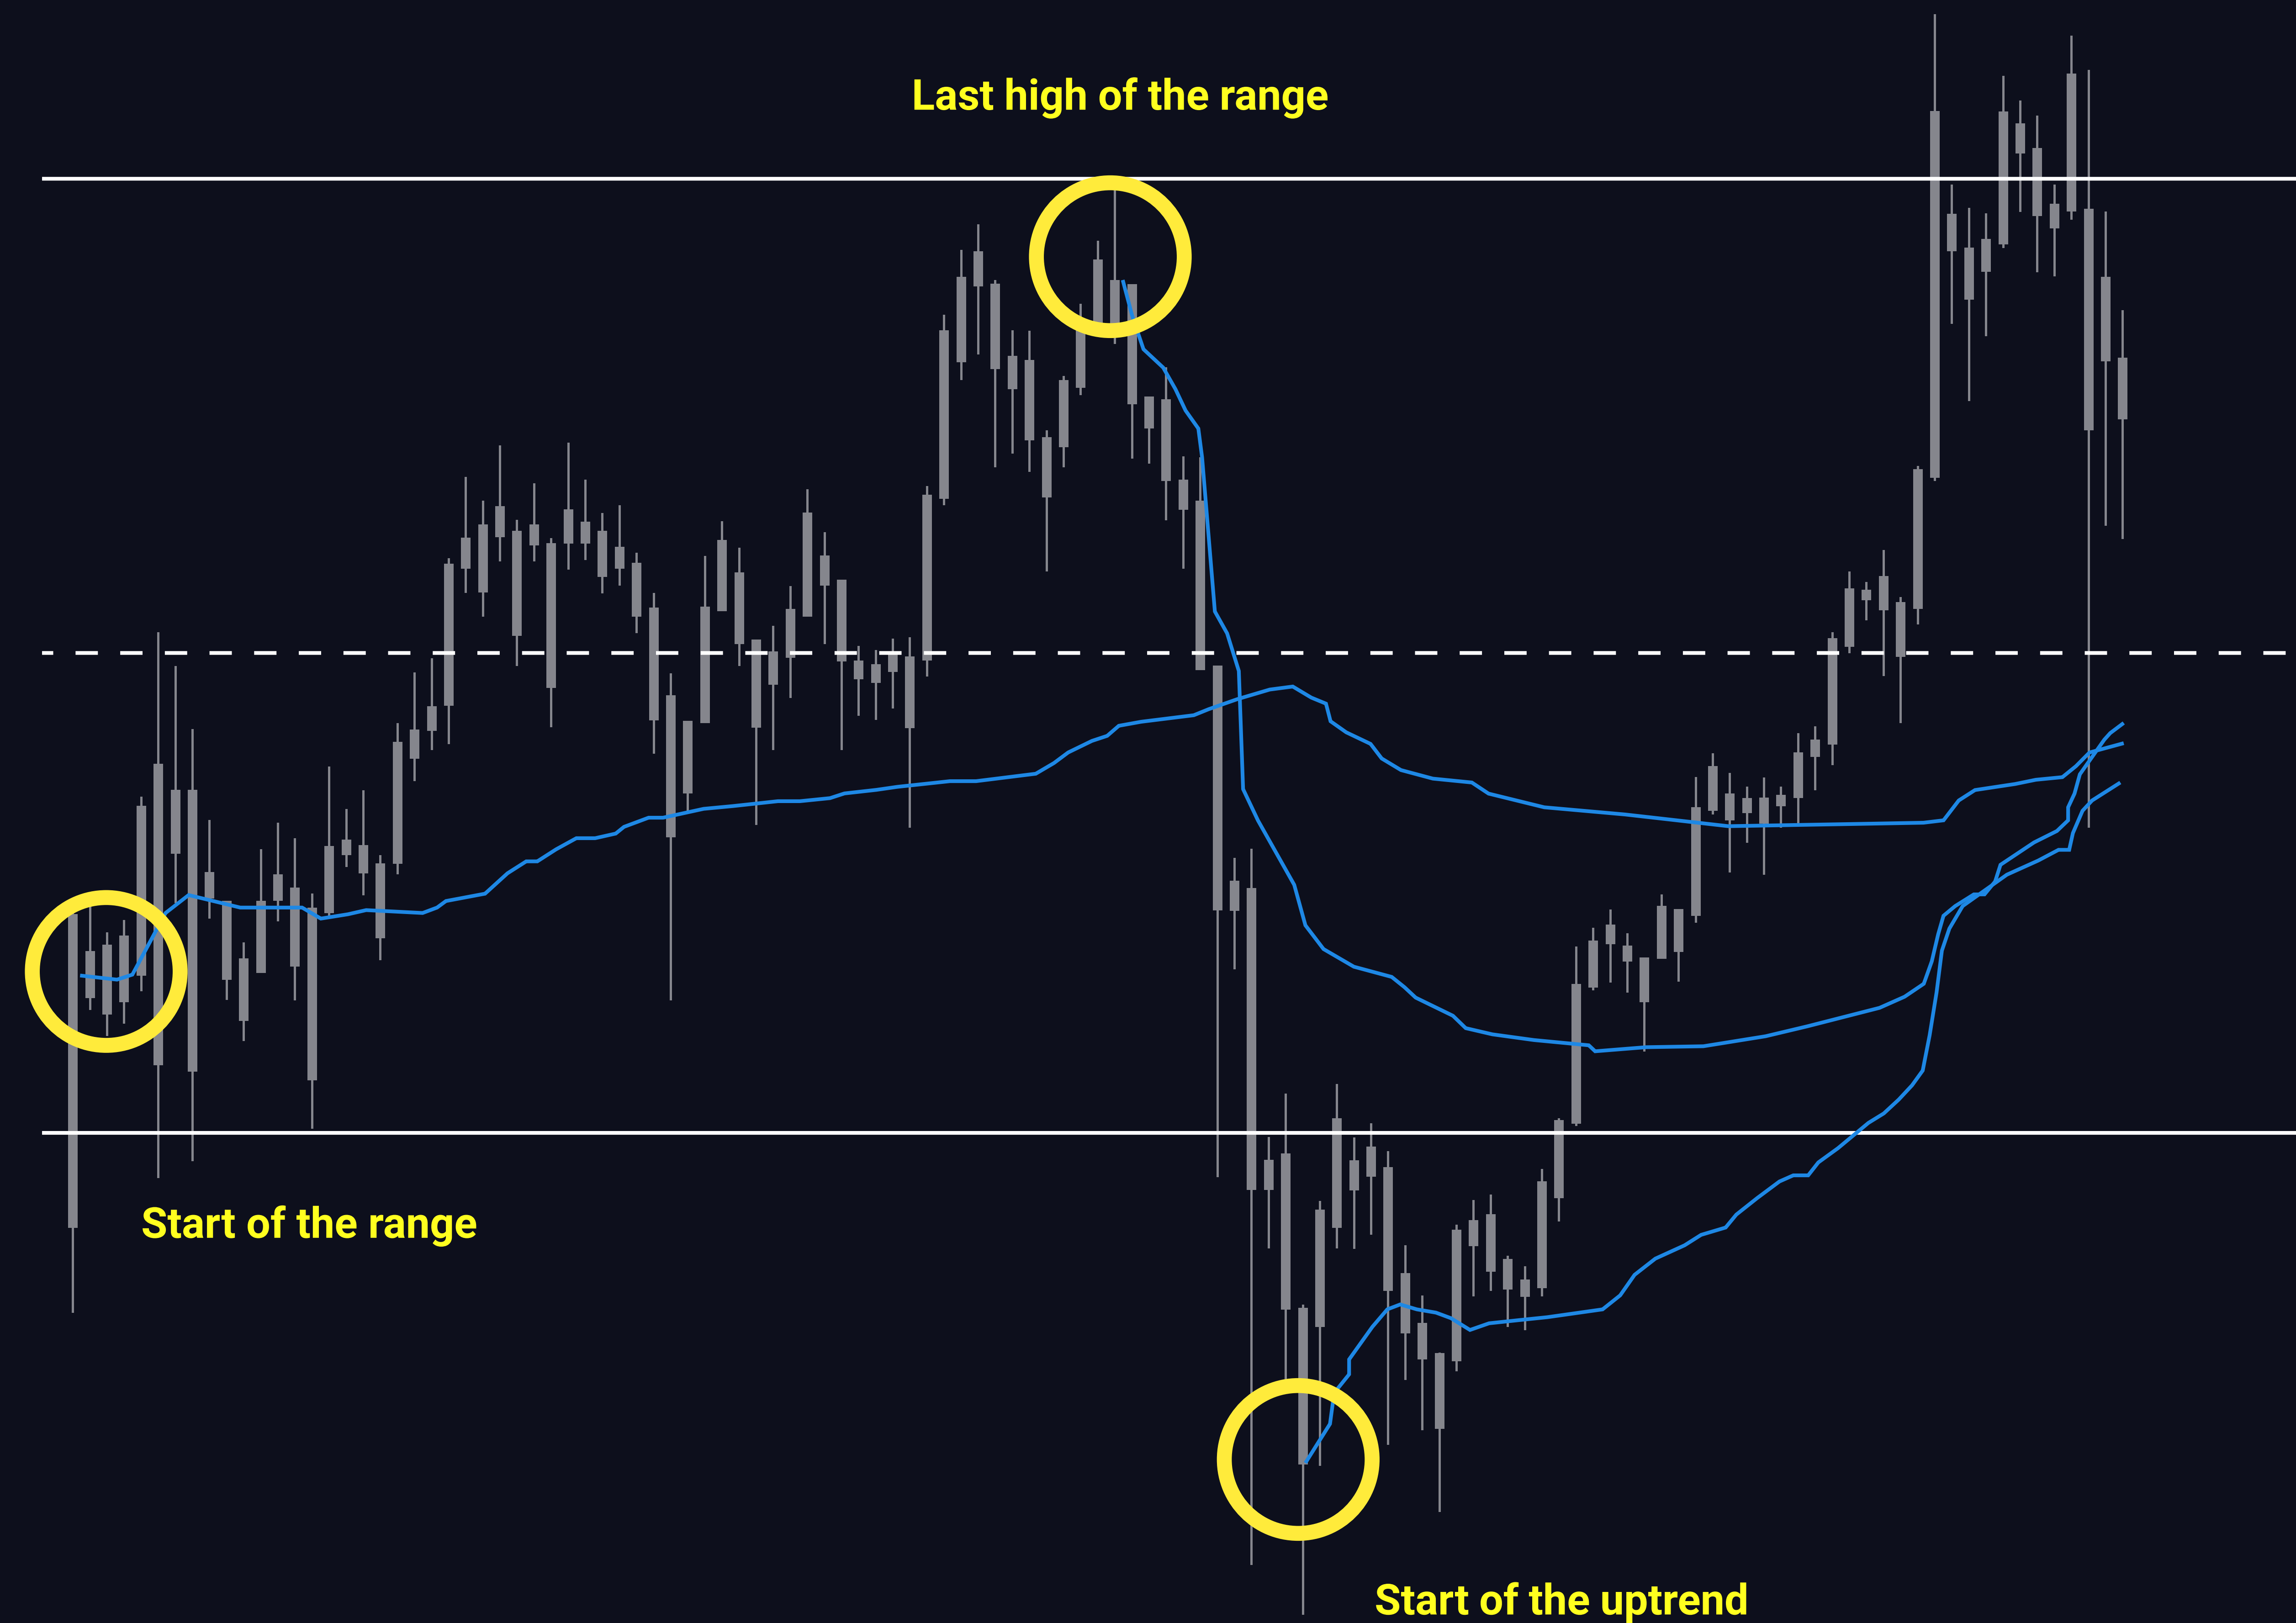

Note: Anchored VWAP is taken from the start of the uptrend on the 4hr chart and it holds as support for a large bounce to the upside. Losing this A-VWAP would be a sign of weakness.

Note: Start of a trend A-VWAP. Price trades through the A-VWAP a few times, but we would still class this as a valid A-VWAP pull.

A-VWAP Confluence

We only trade off an A-VWAP if there is confluence with another tool.

We can place several A-VWAPs to see which ones give the most confluence with other technical analysis tools.

Notice the 3 A-VWAPs for the start of the uptrend, the start of the range, and the last high of the range, all move to the same level, which resulted in that zone being the low.

Tools and Charts module: Anchored VWAP (4:30)
