Bull and Bear Flags

Price will trend up or down before hitting resistance and starting to consolidate. During the consolidation phase you want to see volume decline and preferably stay above/under the .382 depending on if the trend is up or down (Take a Fibonacci retracement from start to finish of the Pole).

The flag consolidation period is relatively short in time and are seen in the middle of a down or uptrend for continuation. Look for confluence when taking the entry within the flag, or wait for the flag to break with a close outside and target a measured move of the flag pole from the breakout and place SL back within the flag.
