CCV 2.0 Setup

The CCV Setup 2.0 is an evolved version of the original CCV setup.

It builds on the same core principle but changes the entry trigger: where we wait for a fakeout of:

- The daily high (for bearish setups),
- The daily low (for bullish setups).

This results in more favourable entries and a significantly improved risk-to-reward ratio.

CCV 2.0 Setup Contenders Lesson

Bearish CCV Setup 2.0

Building the context for a CCV 2.0.

The chart shows the daily opening outside the previous day's value area.

This immediately sets up a potential CCV 2.0 scenario.

Bearish CCV Setup 2.0

Looking for acceptance within pdVA.

We see the price being accepted back into the previous value area, which, in the original CCV, would have been the entry point.

However, in the 2.0 version, we wait instead for a daily fakeout.

Bearish CCV Setup 2.0

The entry trigger.

The following example illustrates the fakeout perfectly.

The price pushes above the daily high, triggering stop-losses from early short traders, and then reverses.

This is our entry trigger for a short position.

Bearish CCV Setup 2.0

CCV 2.0 Target

Finally, the setup is completed with the price targeting and reaching the previous day's VAL, demonstrating how effectively the fakeout setup plays out.
