Chart Champions Value

The Chart Champions Value is also known as the CCV Setup.

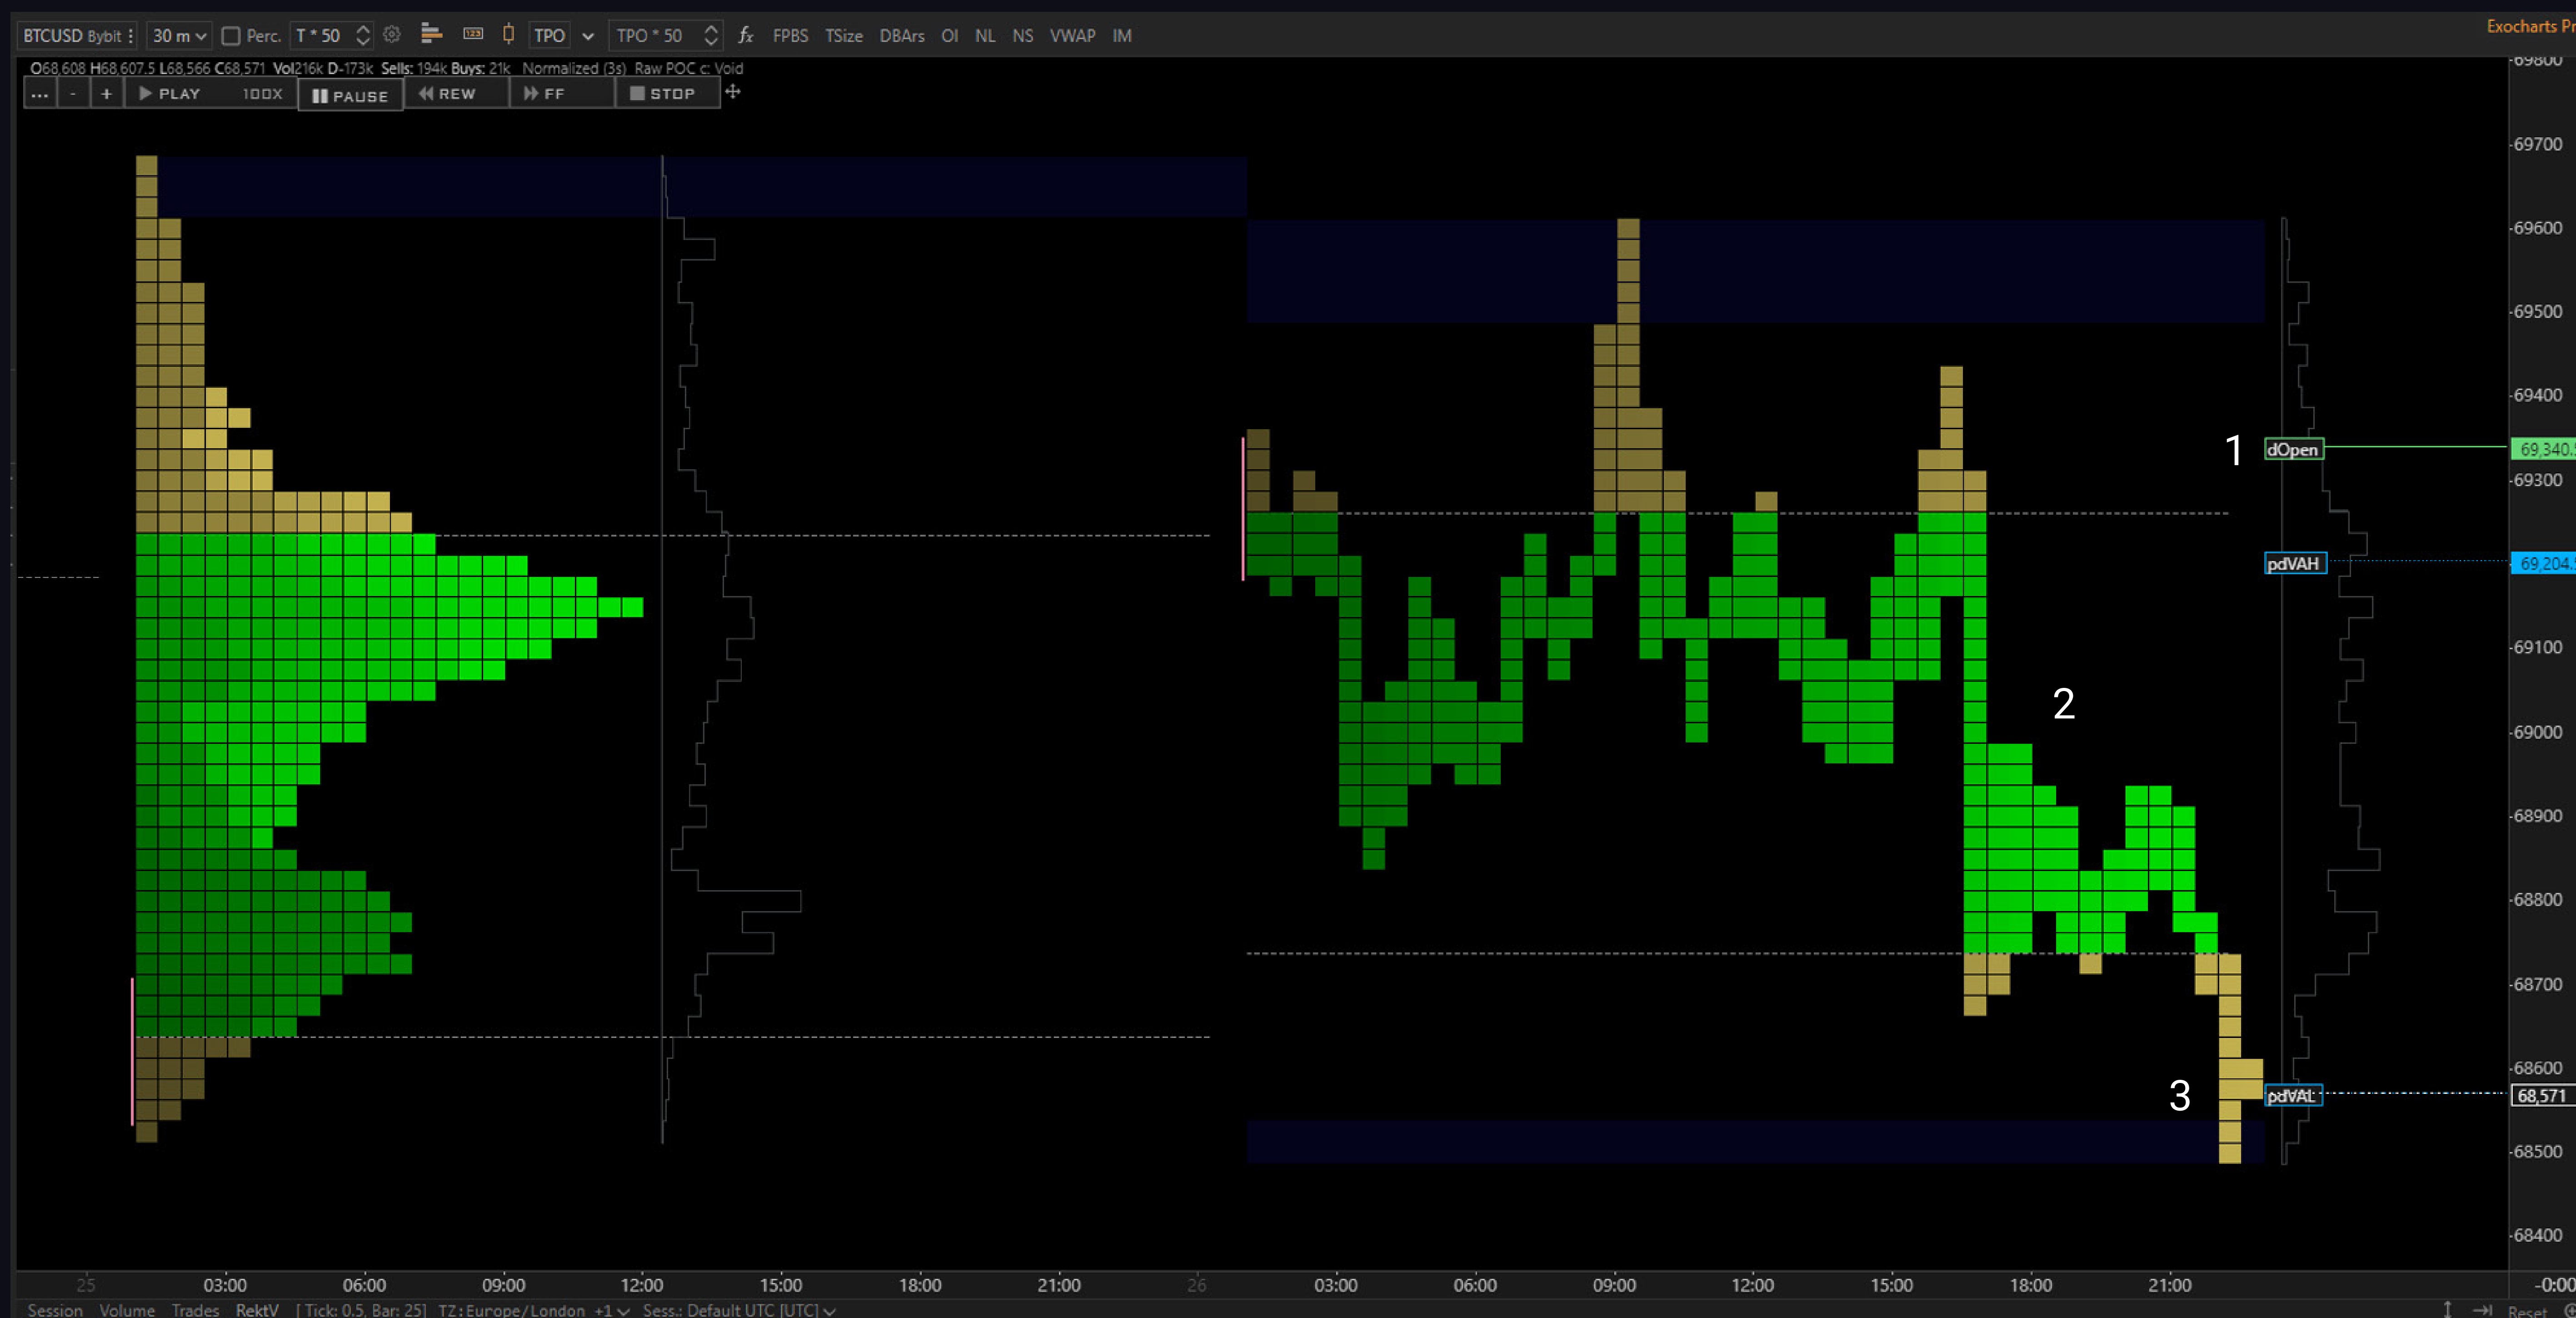

The CCV is a high probability setup that combines the relationship between the Daily Open and previous day Value Areas.

It is valid when the market opens outside of the previous days VAH or VAL but then becomes accepted back into it. The acceptance is classed by two consecutive 30 minute candle closes within the previous day's Value Area.

Strategies module: CCV Setup (9:02)

In the following example we can see the dOpen outside the previous day's VA (1). Once it gets accepted back into the previous day VAH (2) we expect the price to continue to the previous day VAL (3).

If the price breaks above pdVAH, this level should act as support.

If the price breaks below pdVAL, this level should act as resistance.

If we are in a range and the market opens outside of the previous day VA and gets accepted back into it, we expect the price to continue to range back to the other side of the previous day's VA.

The importance of context

The interpretation of overall market condition is crucial in this setup to help us to not blindly enter a trade. It's important to look at the context of the last few days as well as other technical factors to use as confluences so we can decide which trades to take and which ones are not good.

"Trade the range until it breaks"

If the day prior was range bound, and the following day opens outside of value in a low volume range, we would expect this to be the "perfect" scenario for this setup.

The importance of context

When we have a valid CCV Setup but the price had a strong move the day prior, with high volume and increases in Open Interest, it's very unlikely to fully reverse that move.

It's more likely to remain range bound that day to allow Open Interest to build. In this instance we would not take the setup as the context is not in our favour.
