

Cumulative Volume Delta

Cheat Sheet

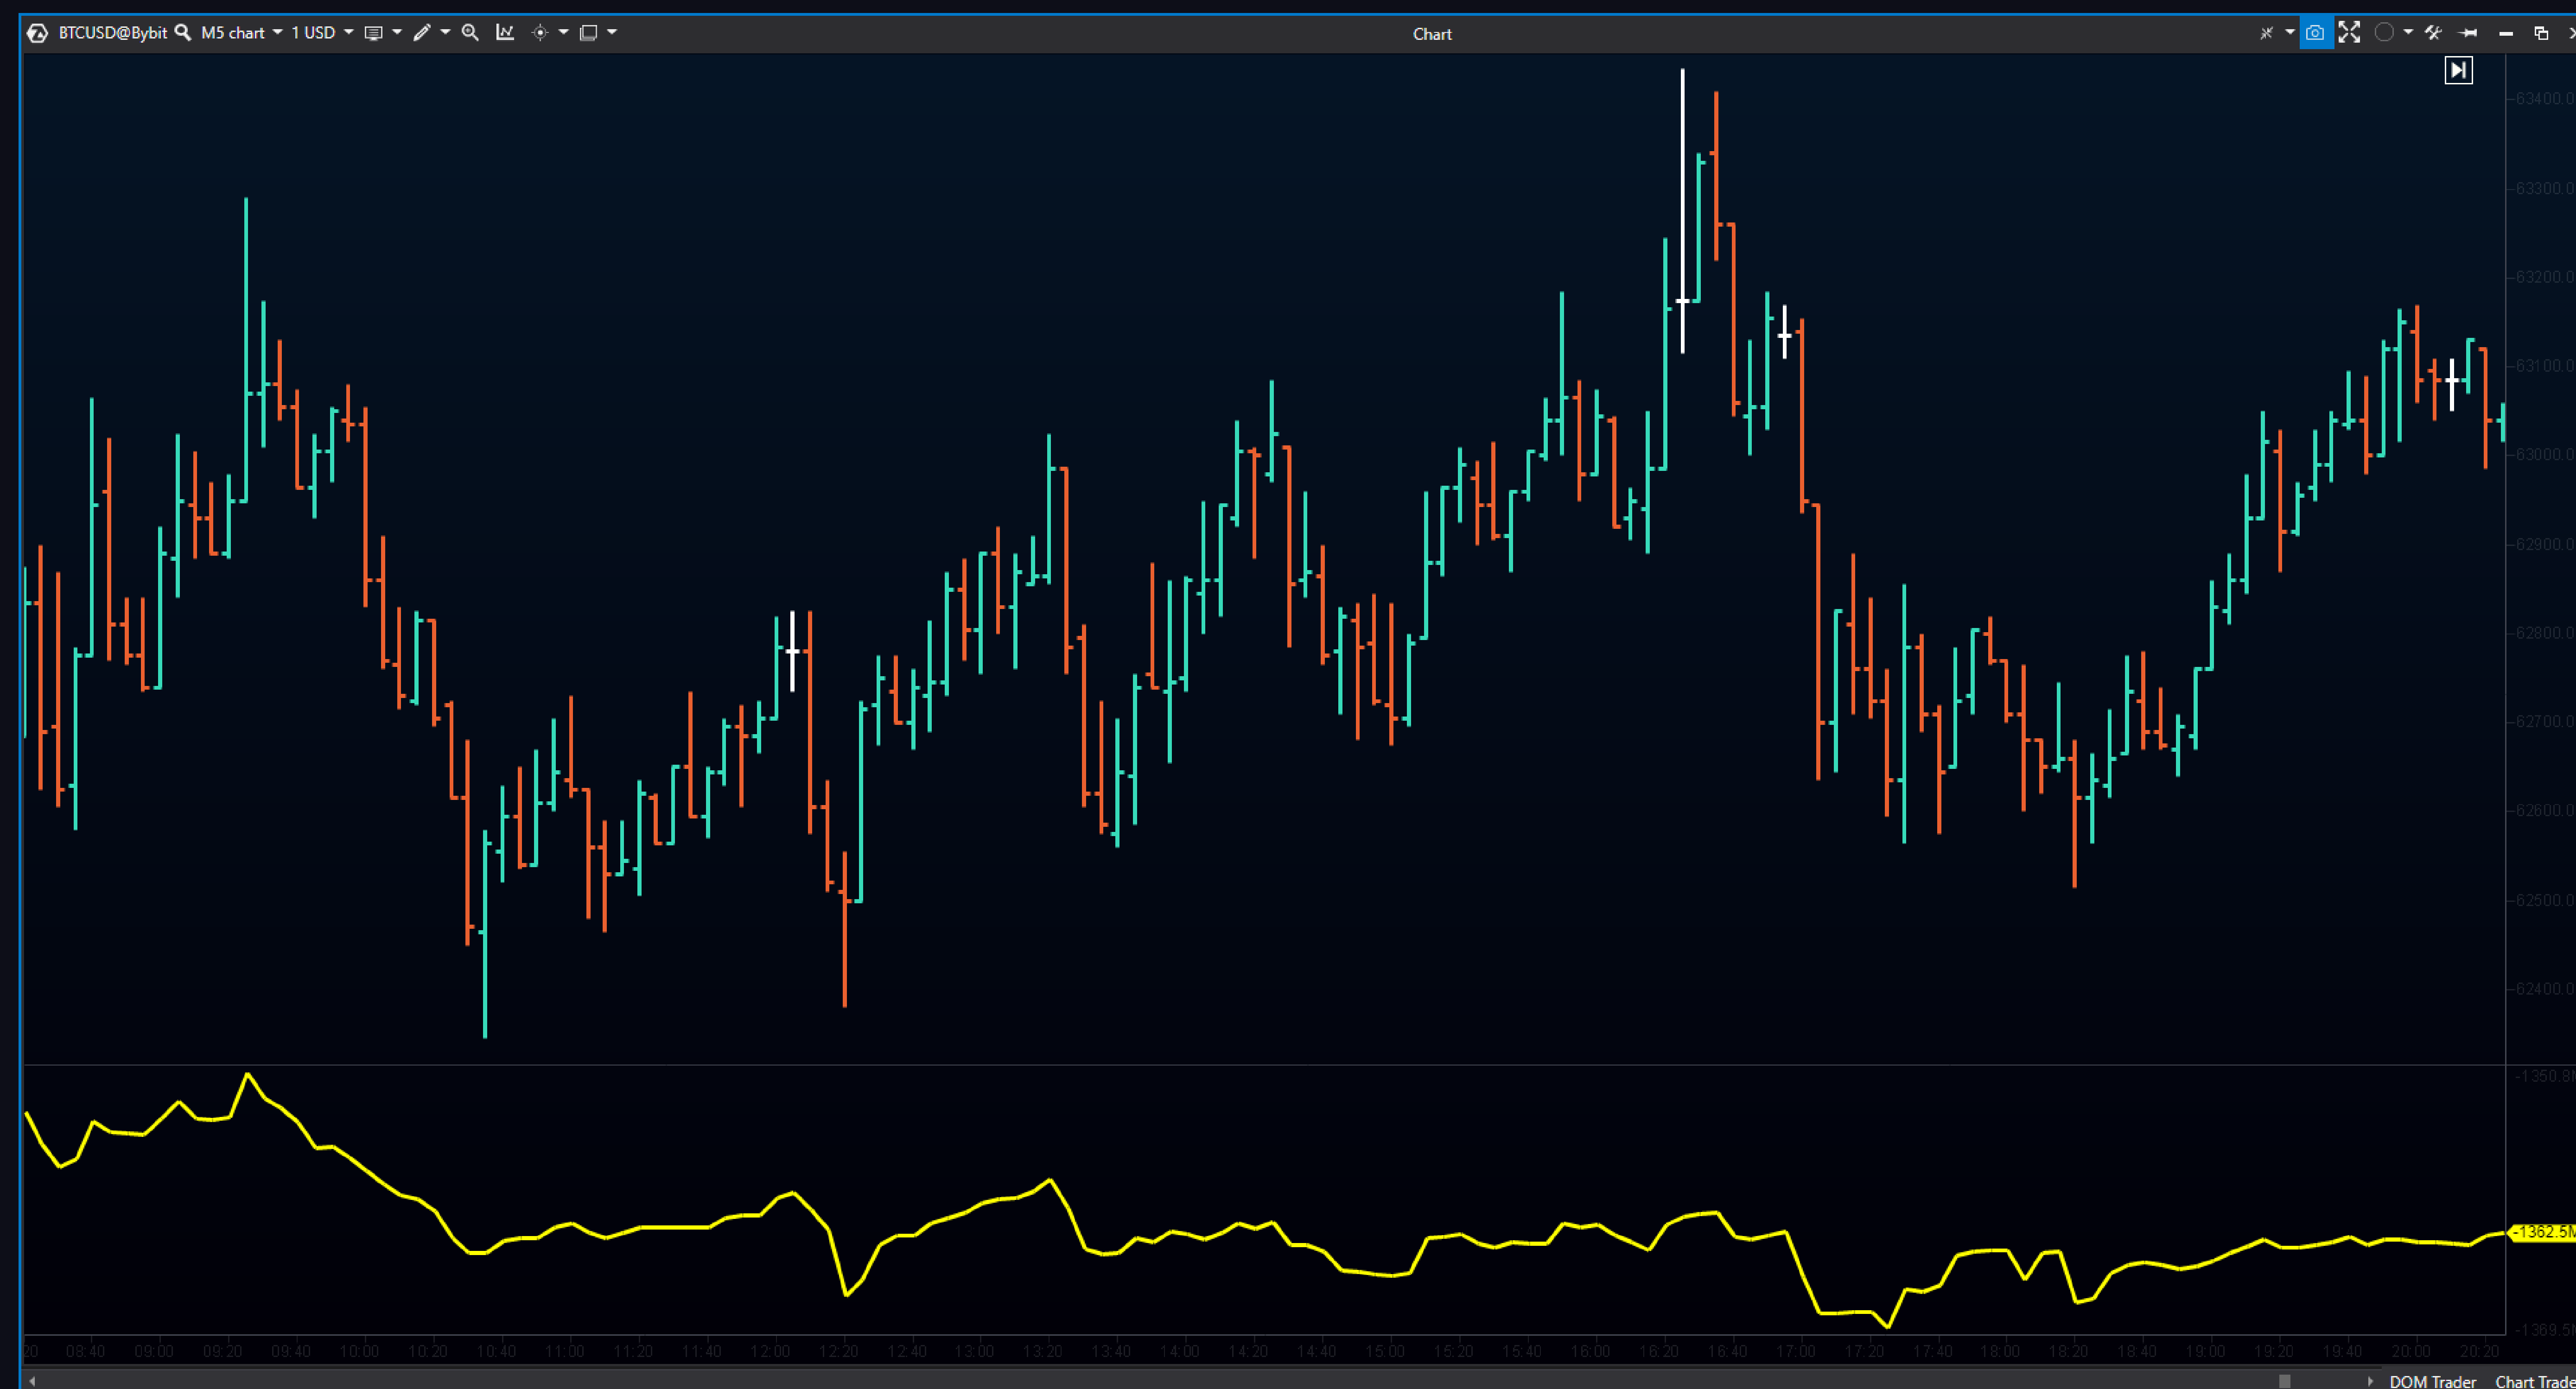

Shows the buying and selling pressure.

CVD is adding and removing delta together: Market buys on the Ask are added to the total, and market sells on the Bid are subtracted from the cumulative total.

Settings:

- CVD Type: Full data
- CVD Type Line: Visible range
- Time frame: from 1 minute to 30 minutes.

Passive orders at limit provide liquidity to the market. Limit orders are generally used by bigger traders. We want to see evidence of where they are trading.

We want to see divergences build up over time (evidence of absorption) rather than 1 candle drop/wick/stop run that forms a divergence.

[Footprint module: CVD Lesson \(13:28\)](#)

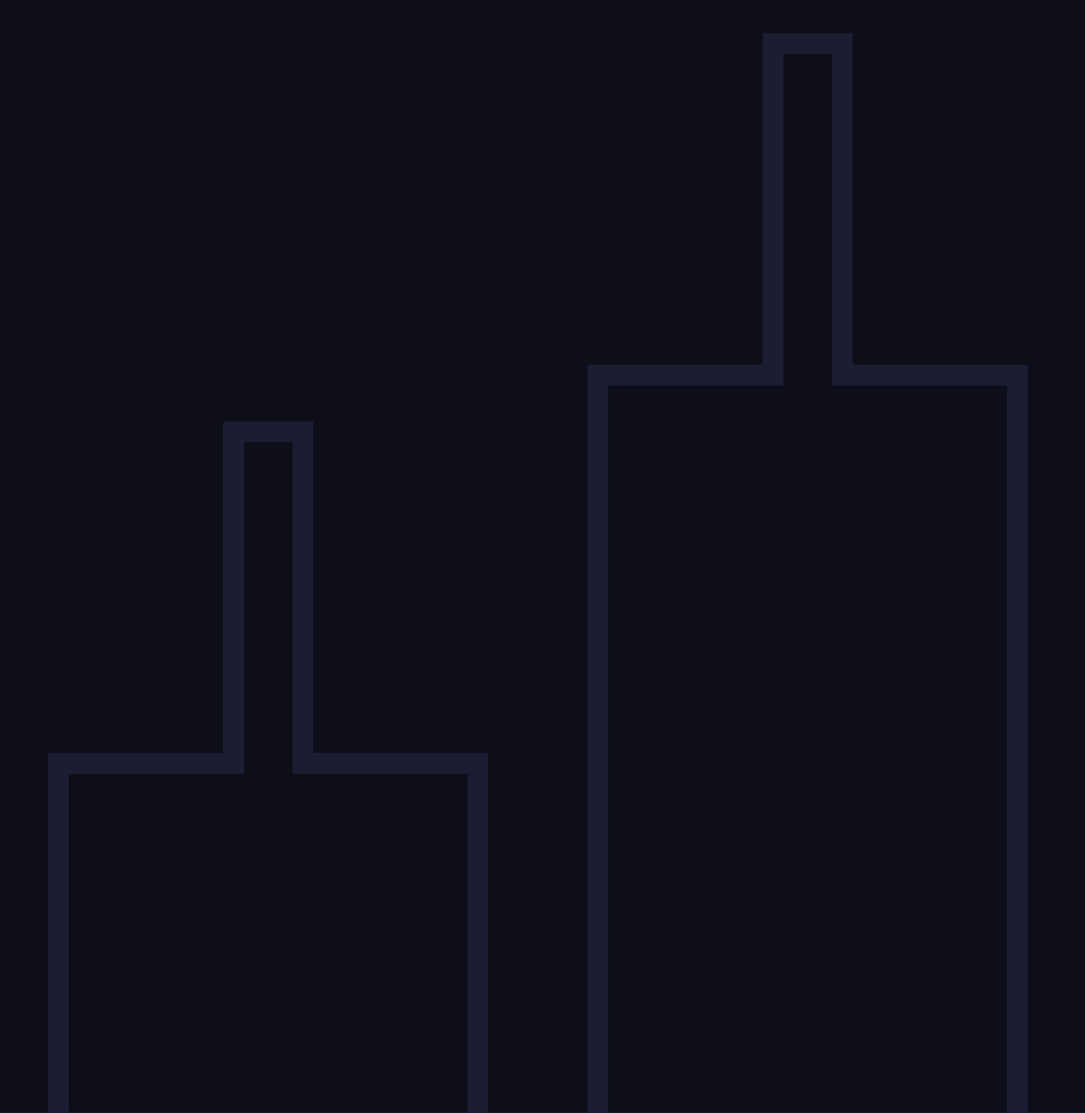

CVD Bullish Divergence

We favour bullish CVD Divergences at support and as a confluence upon a key level being hit.

There is a move to the downside and the price goes sideways for a while and then attempts to move down again. Price forms a higher low but CVD has made a lower low. This shows us that people are aggressively market selling but the price is unable to take the low because bigger traders are absorbing the sells with limit buy orders. Confirmation of a long would be a break of market structure.

[Footprints module: CVD Lesson \(24:00\)](#)

CVD Bearish Divergence

We favour bearish CVD Divergences at resistance and as a confluence upon a key level being hit.

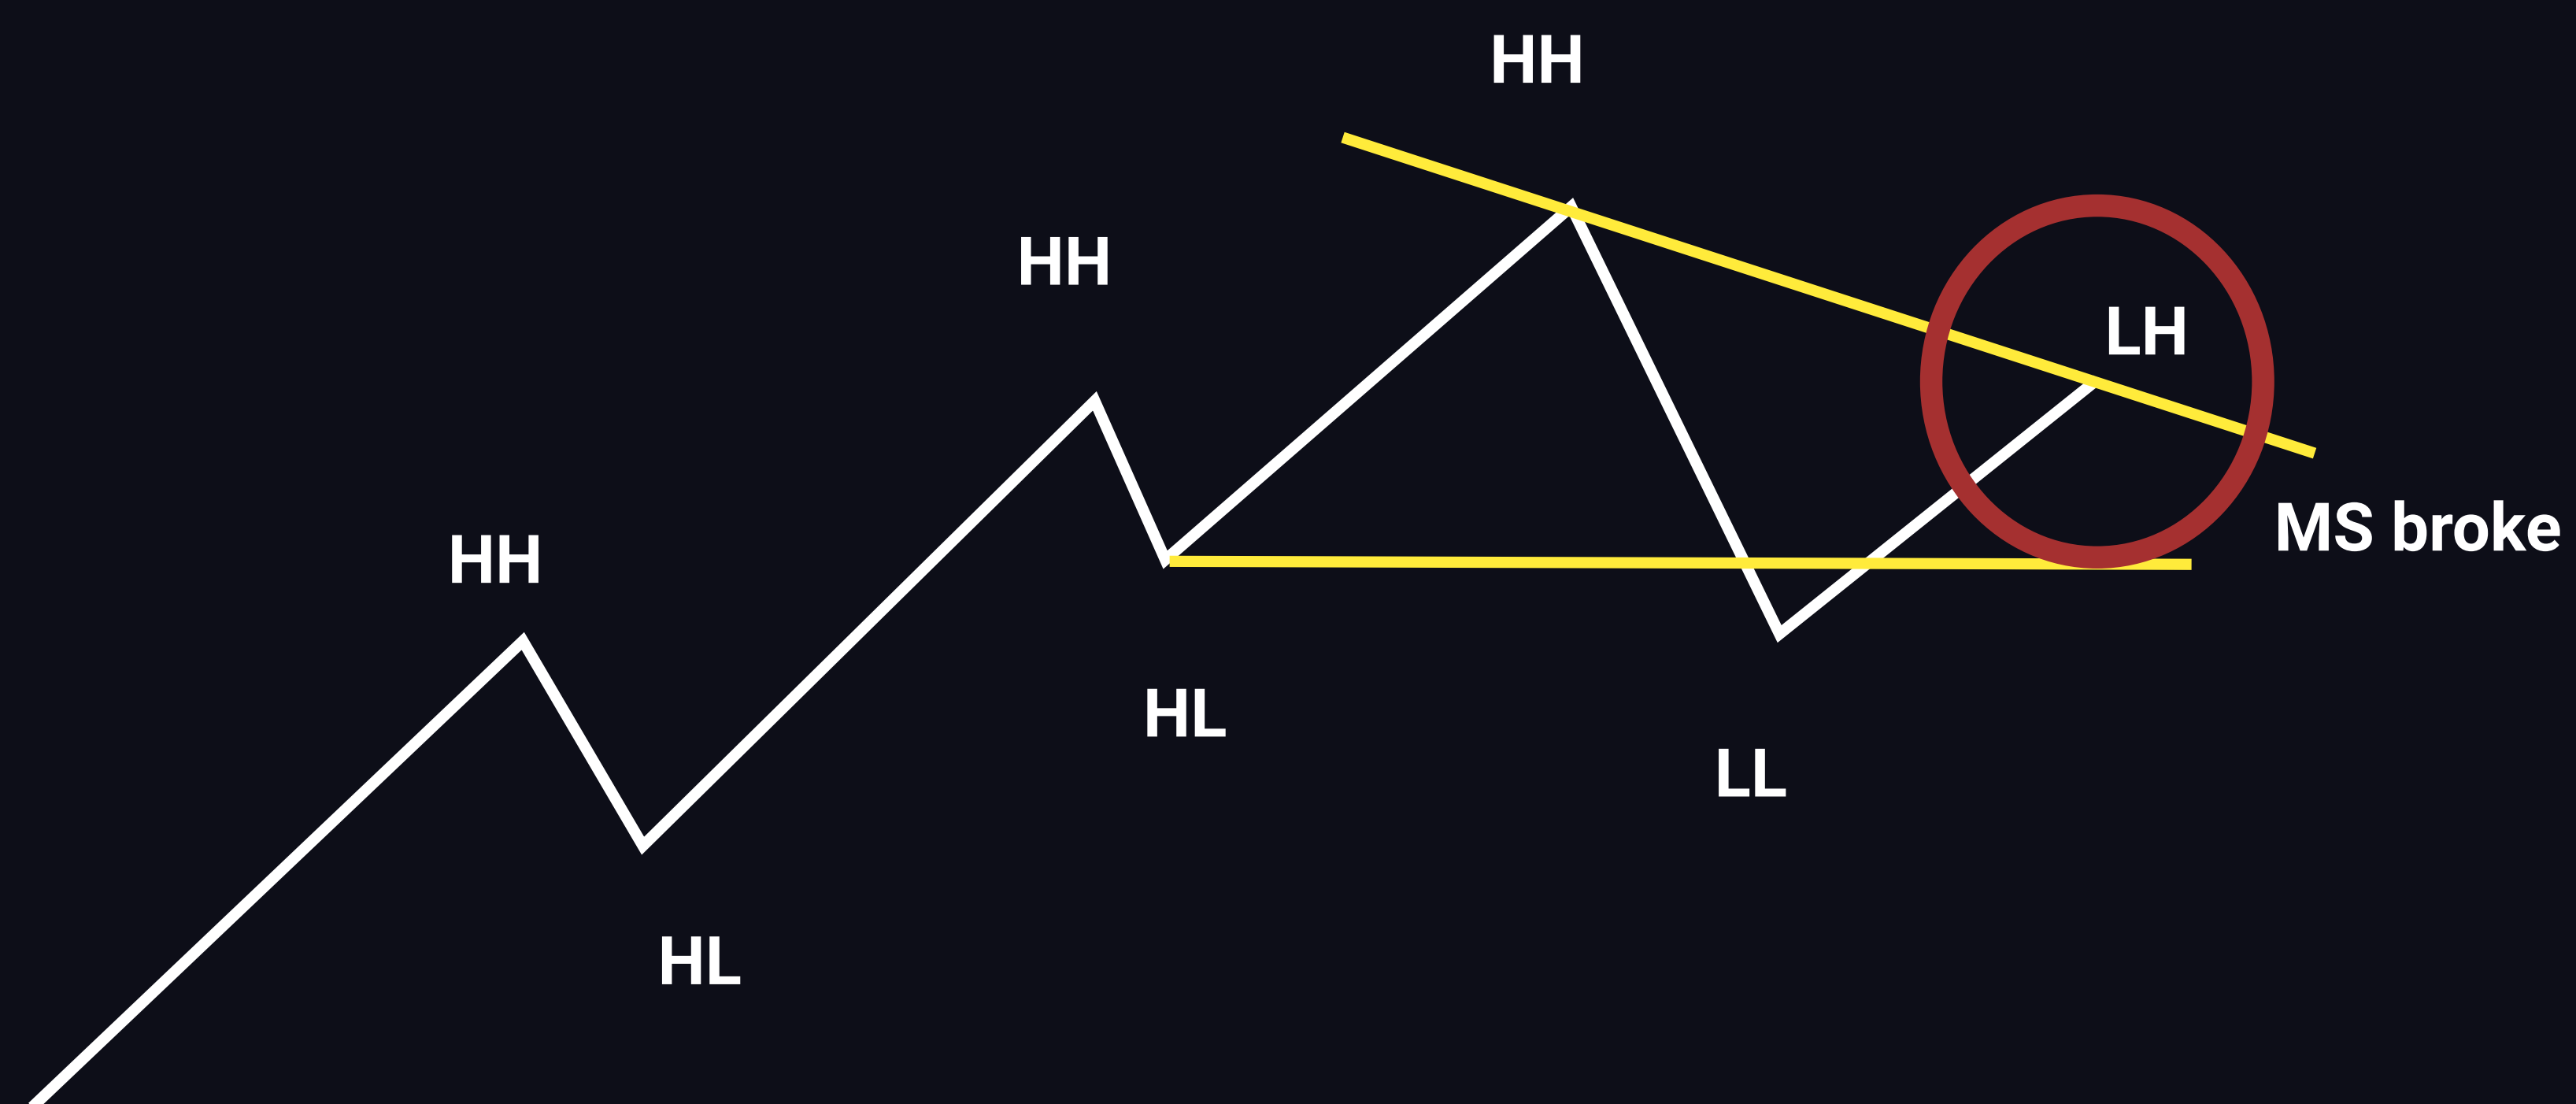

There is a move to the upside and the price goes sideways for a while and then attempts to move up again. Price forms a lower high but CVD has made a higher high. This shows people are aggressively market buying but the price is unable to take the high because bigger traders are absorbing all the buys with limit sell orders. Confirmation of a short would be a break of market structure.

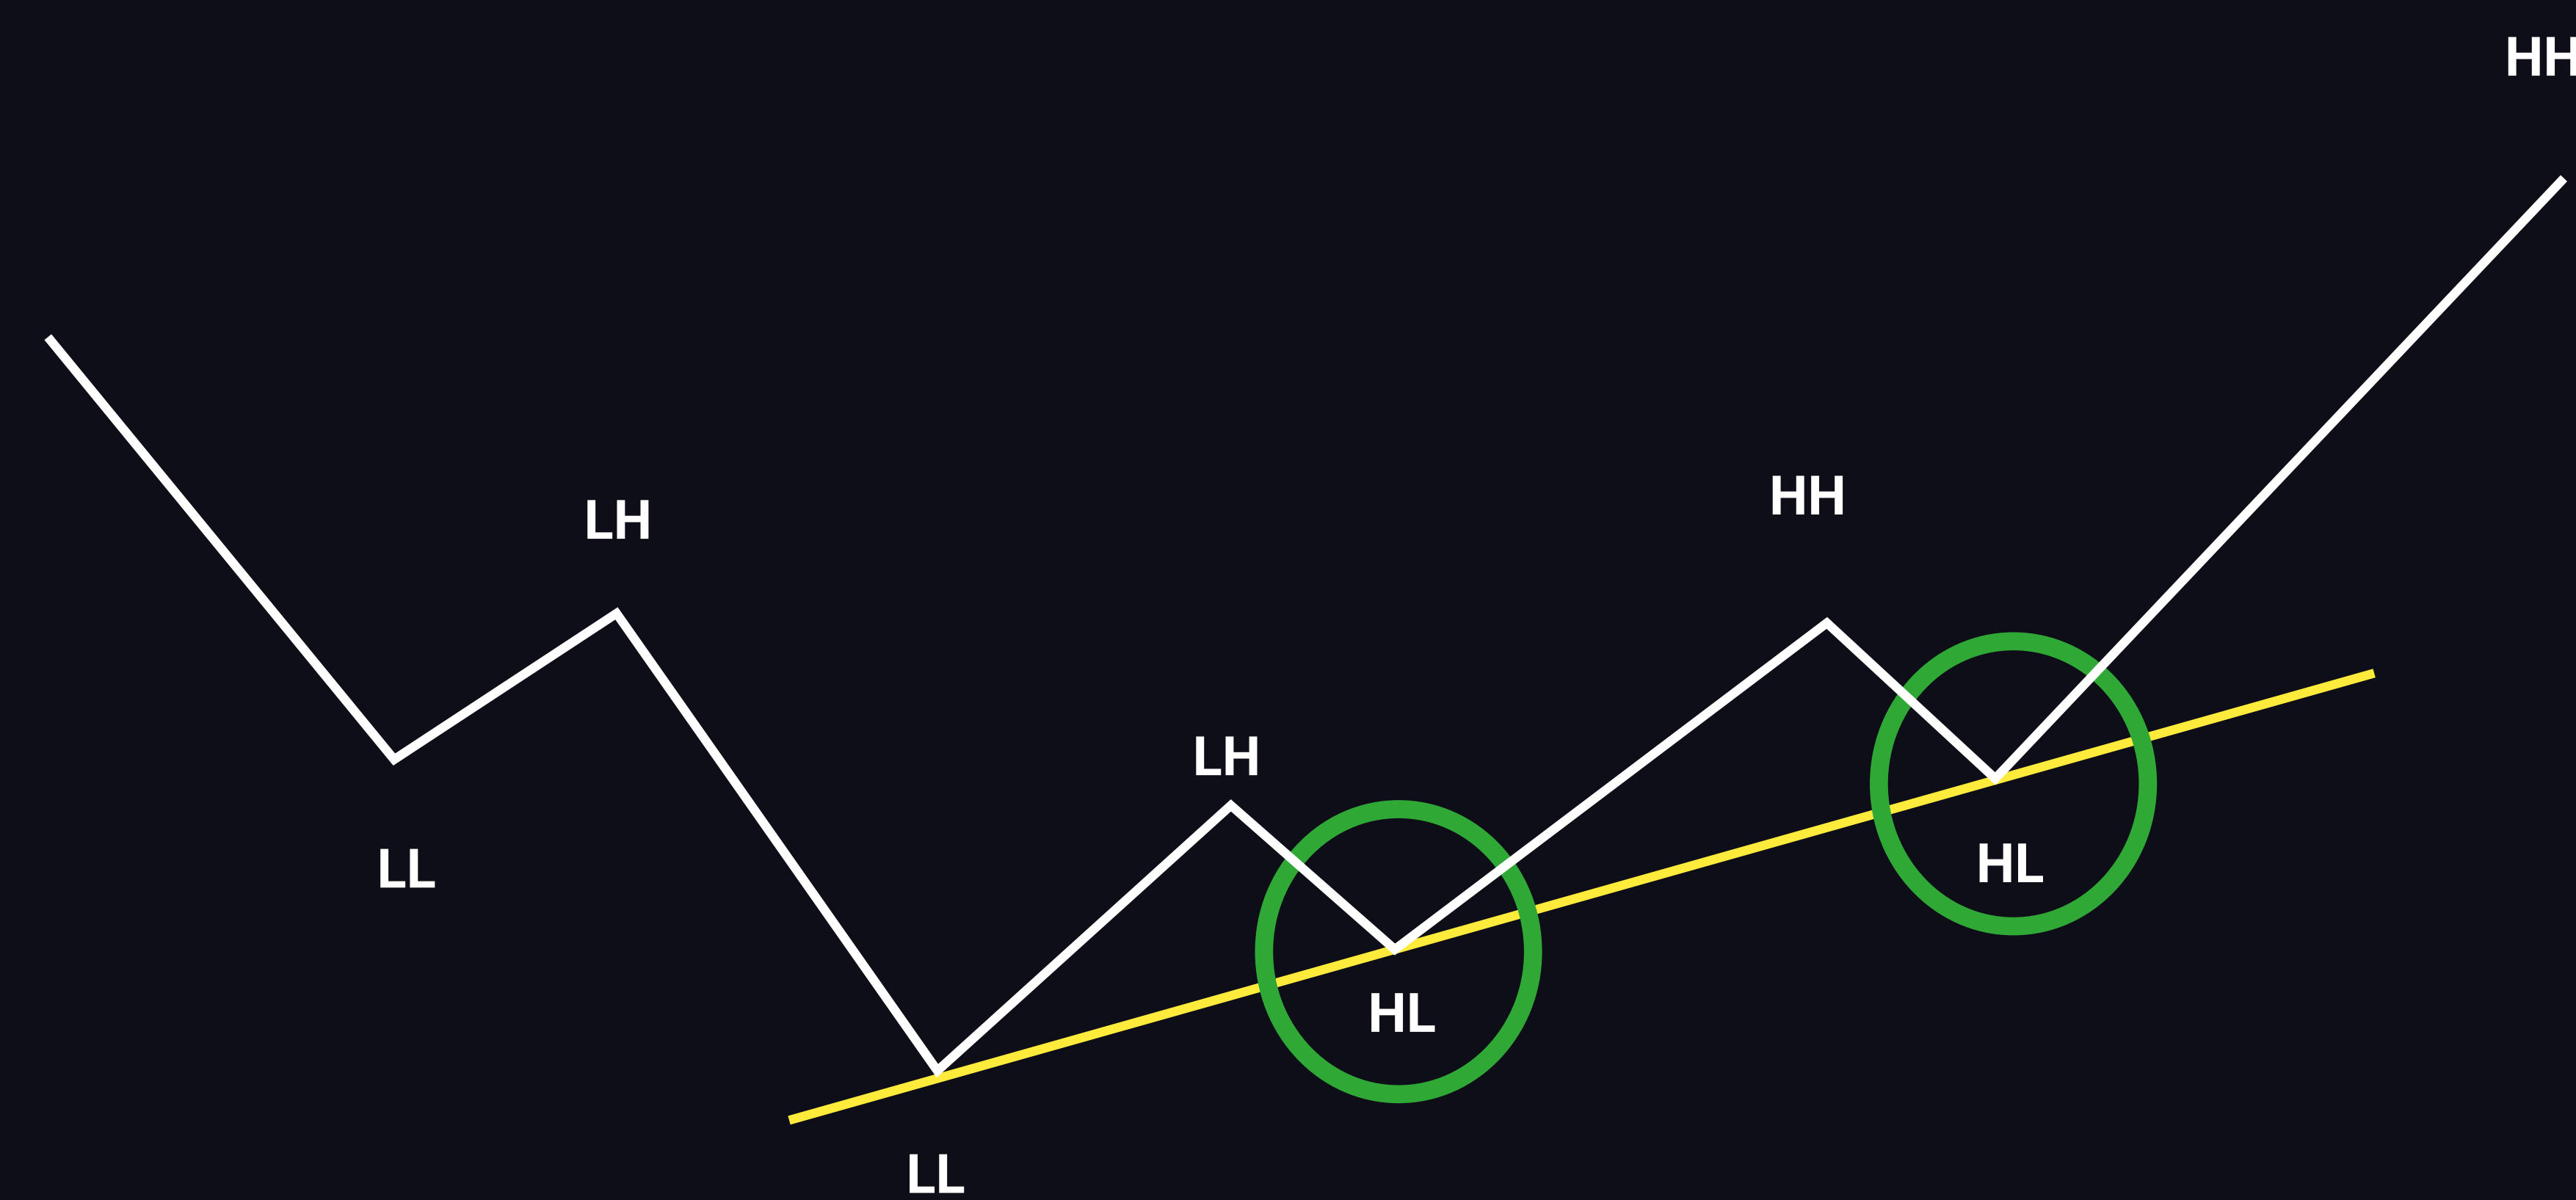

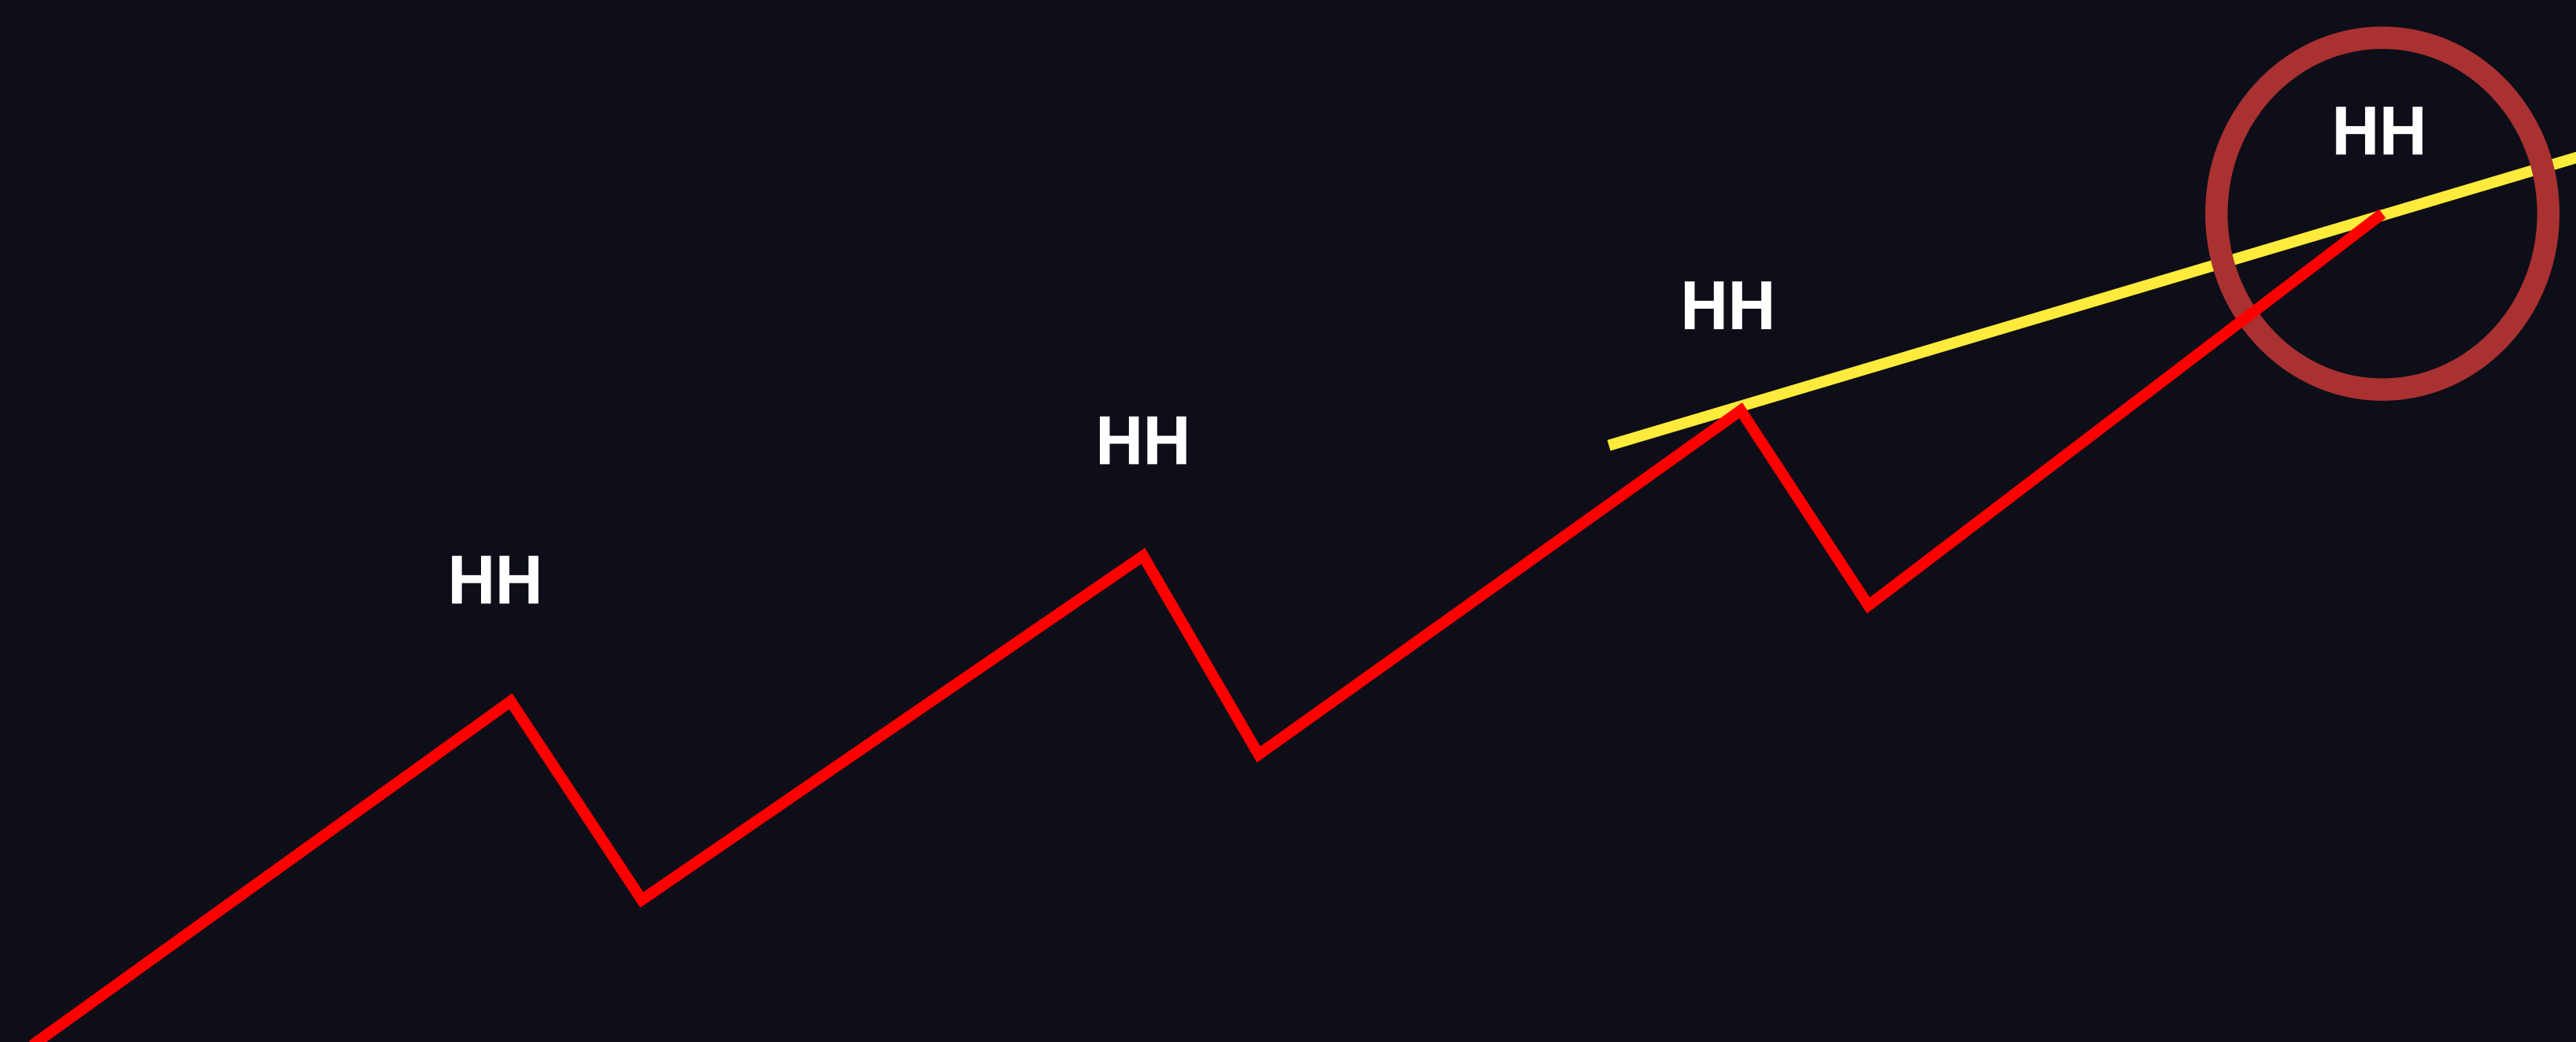

[Footprints module: CVD Lesson \(28:12\)](#)

Bullish and Bearish CVD Divergences

Bearish Divergence:
Price makes lower high.
CVD makes higher high.

Bullish Divergence:
Price makes higher low.
CVD makes lower low.
