

Delta

Cheat Sheet

Delta provides the total sum of market orders in any given session. It shows whether buyers or sellers are in control of the current candle.

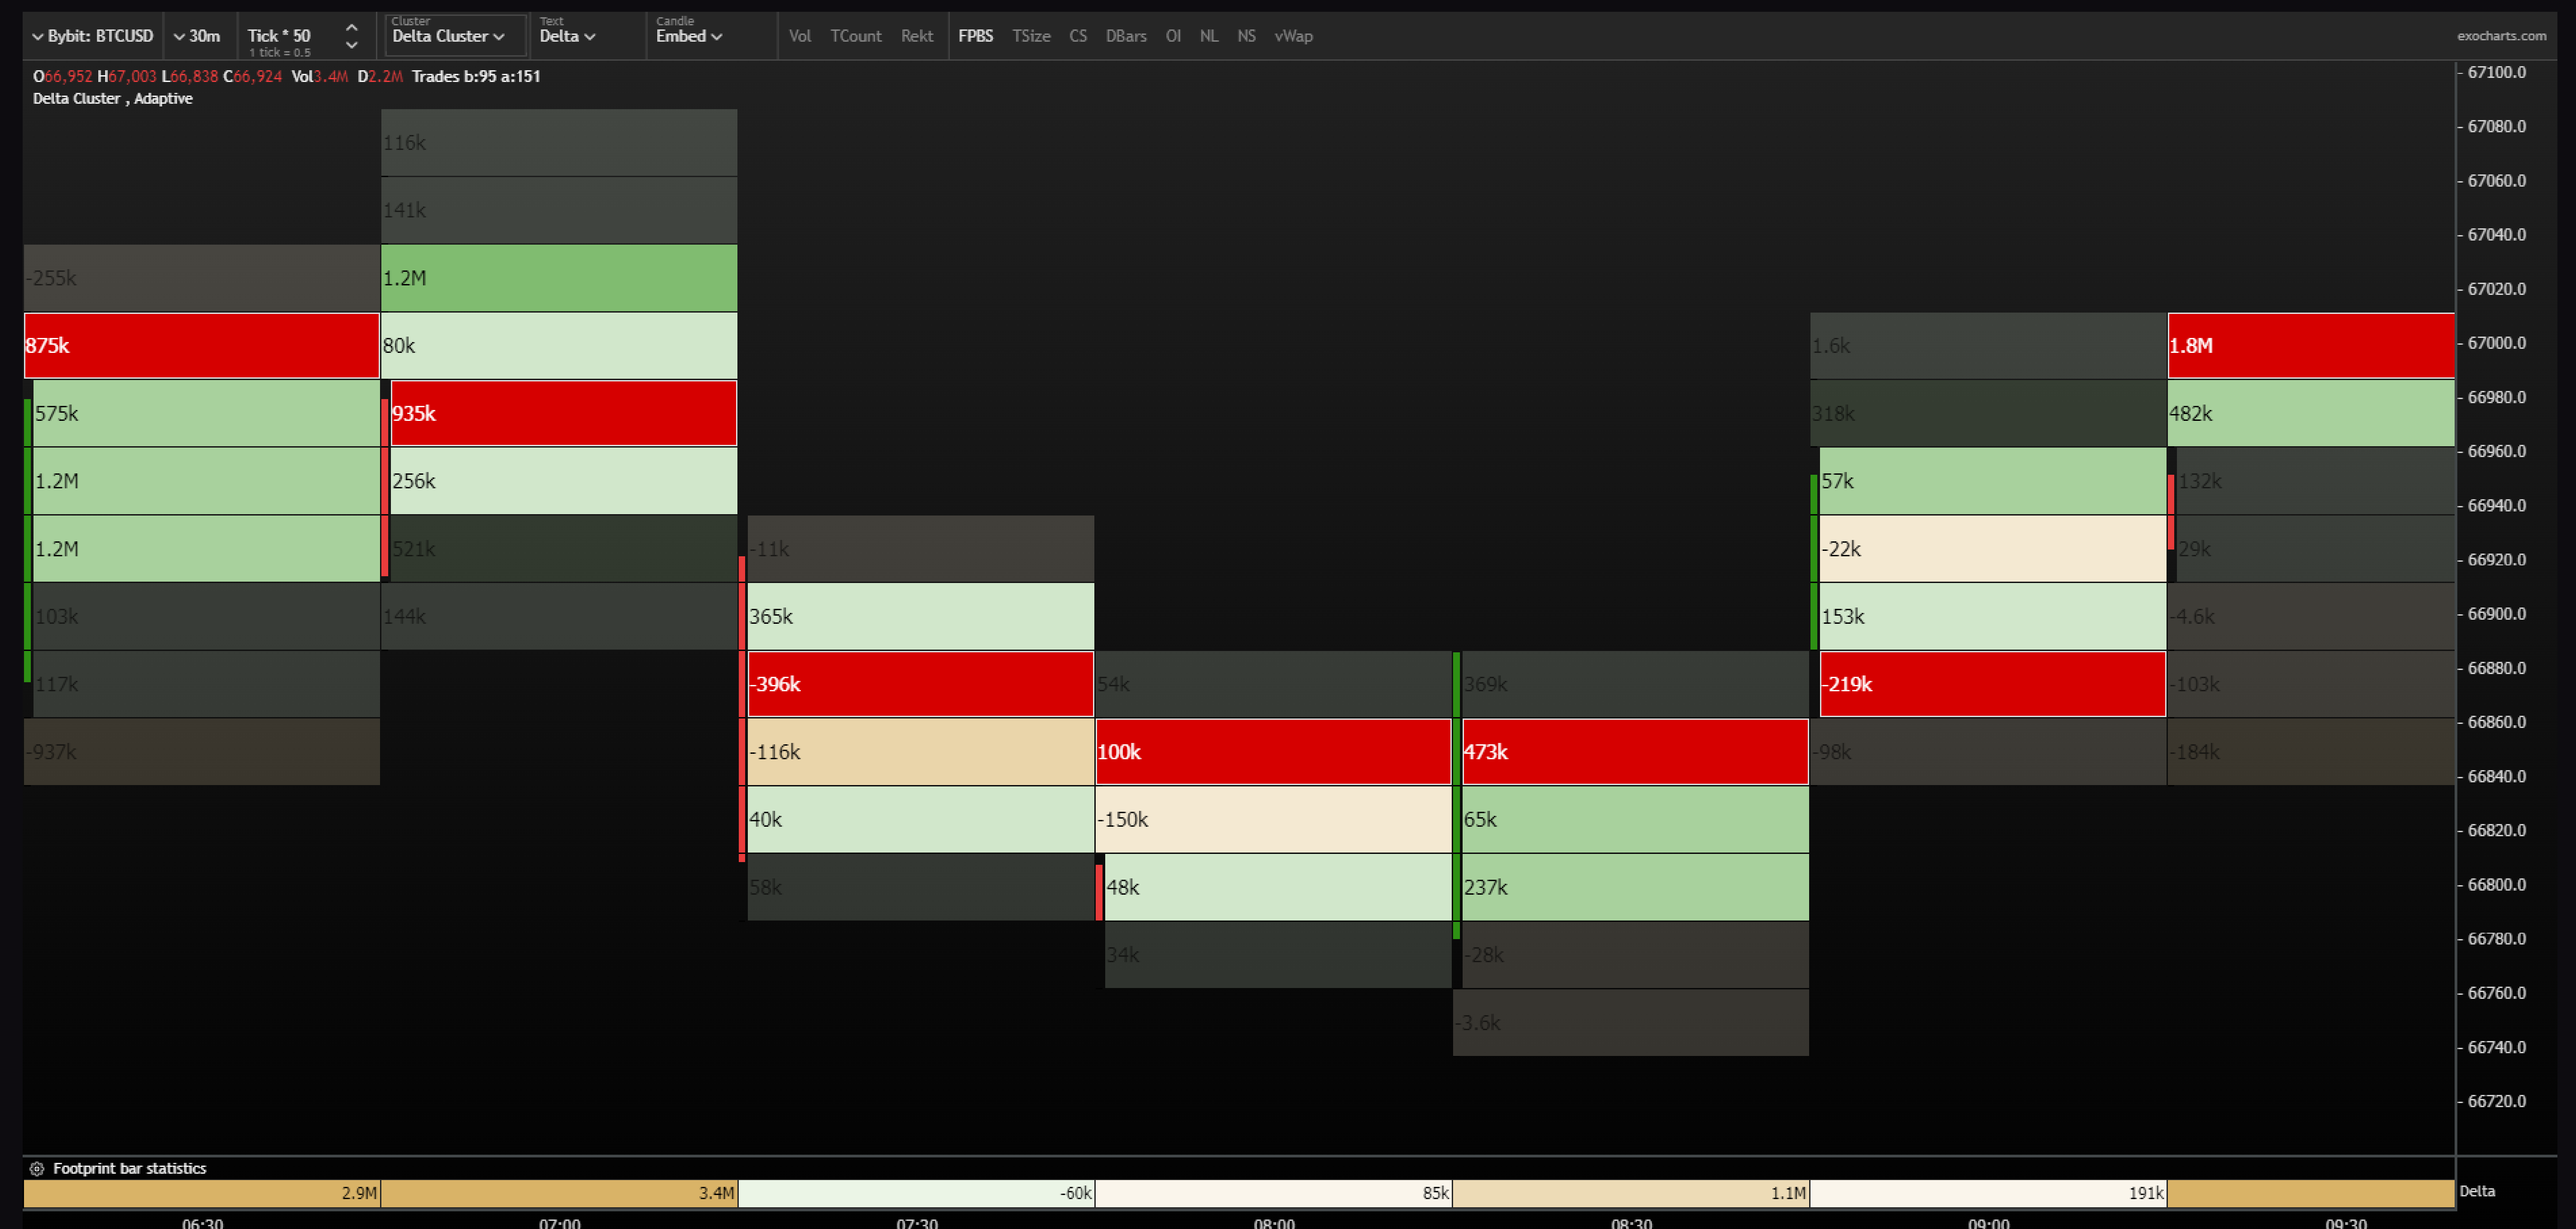

Delta = Buys - Sells

If the Delta is very negative with high volume = sellers are dominant.

If the Delta is very positive with high volume = buyers are dominant.

Foorprints module: Delta (14:29)

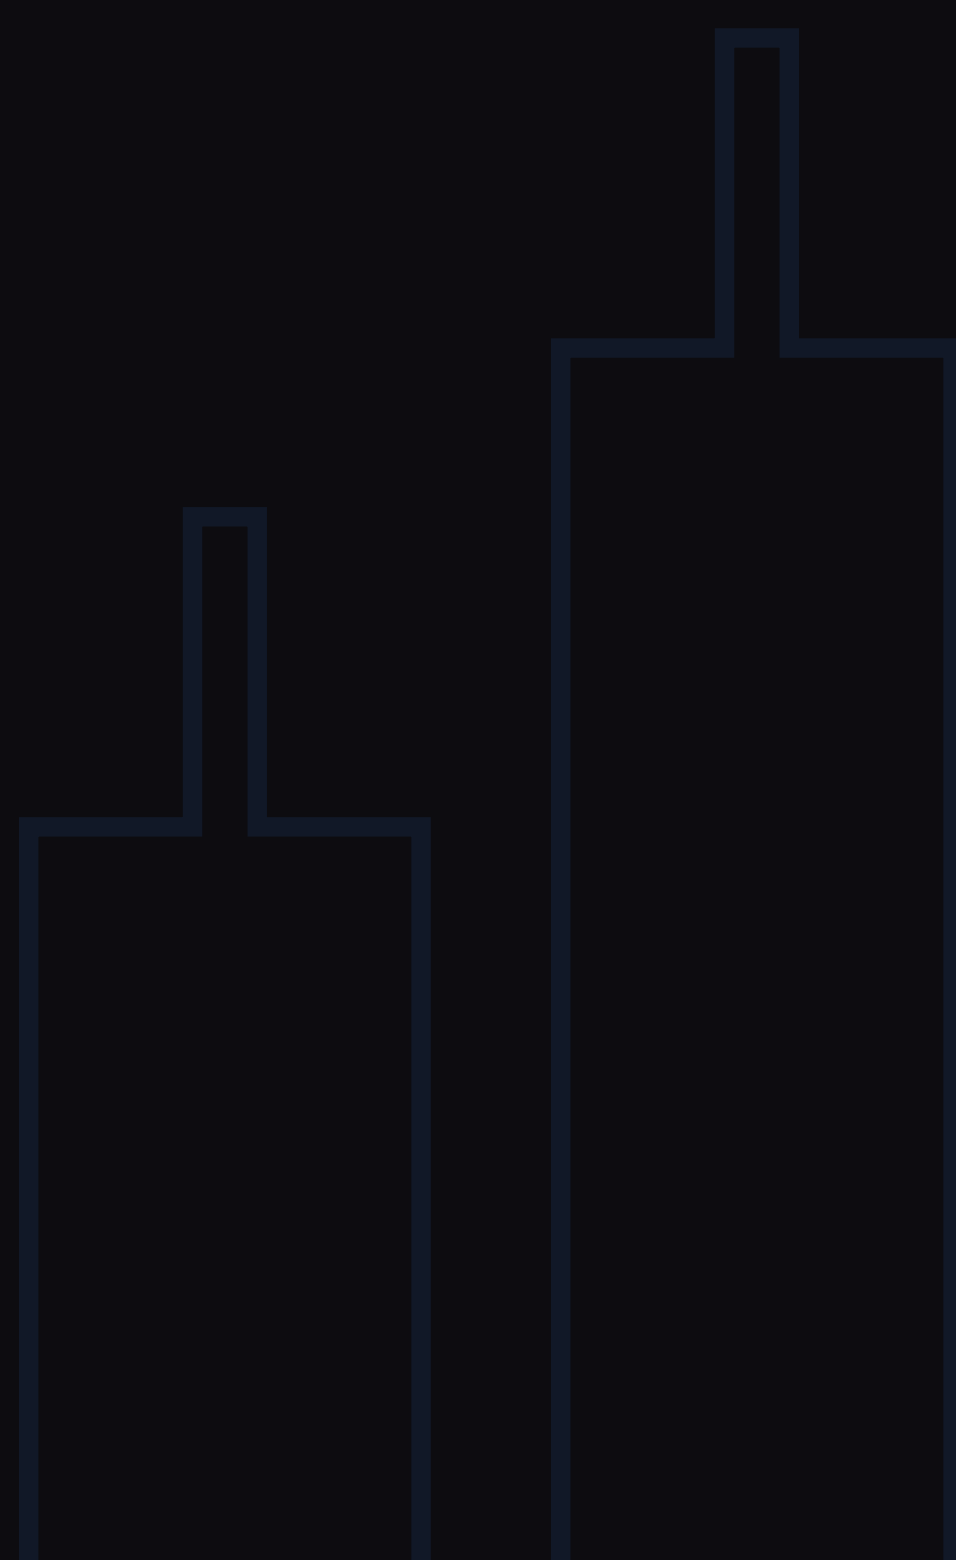

Delta is useful to determine possible breakouts of a range and reversals at key levels.

We need order flow software such as Exocharts, ATAS or Quantower to see the Delta. It can be used in conjunction with Open interest, Volume and Cumulative Volume Delta.

In this example, we can see the Delta of each price within the candle and at the bottom of the chart we can see the overall Delta for the whole candle.

The Delta Clusters show areas on the chart with high Delta in darker shading.

If the price revisits a Delta cluster we can expect a reaction or reverse in price as shown in this example.

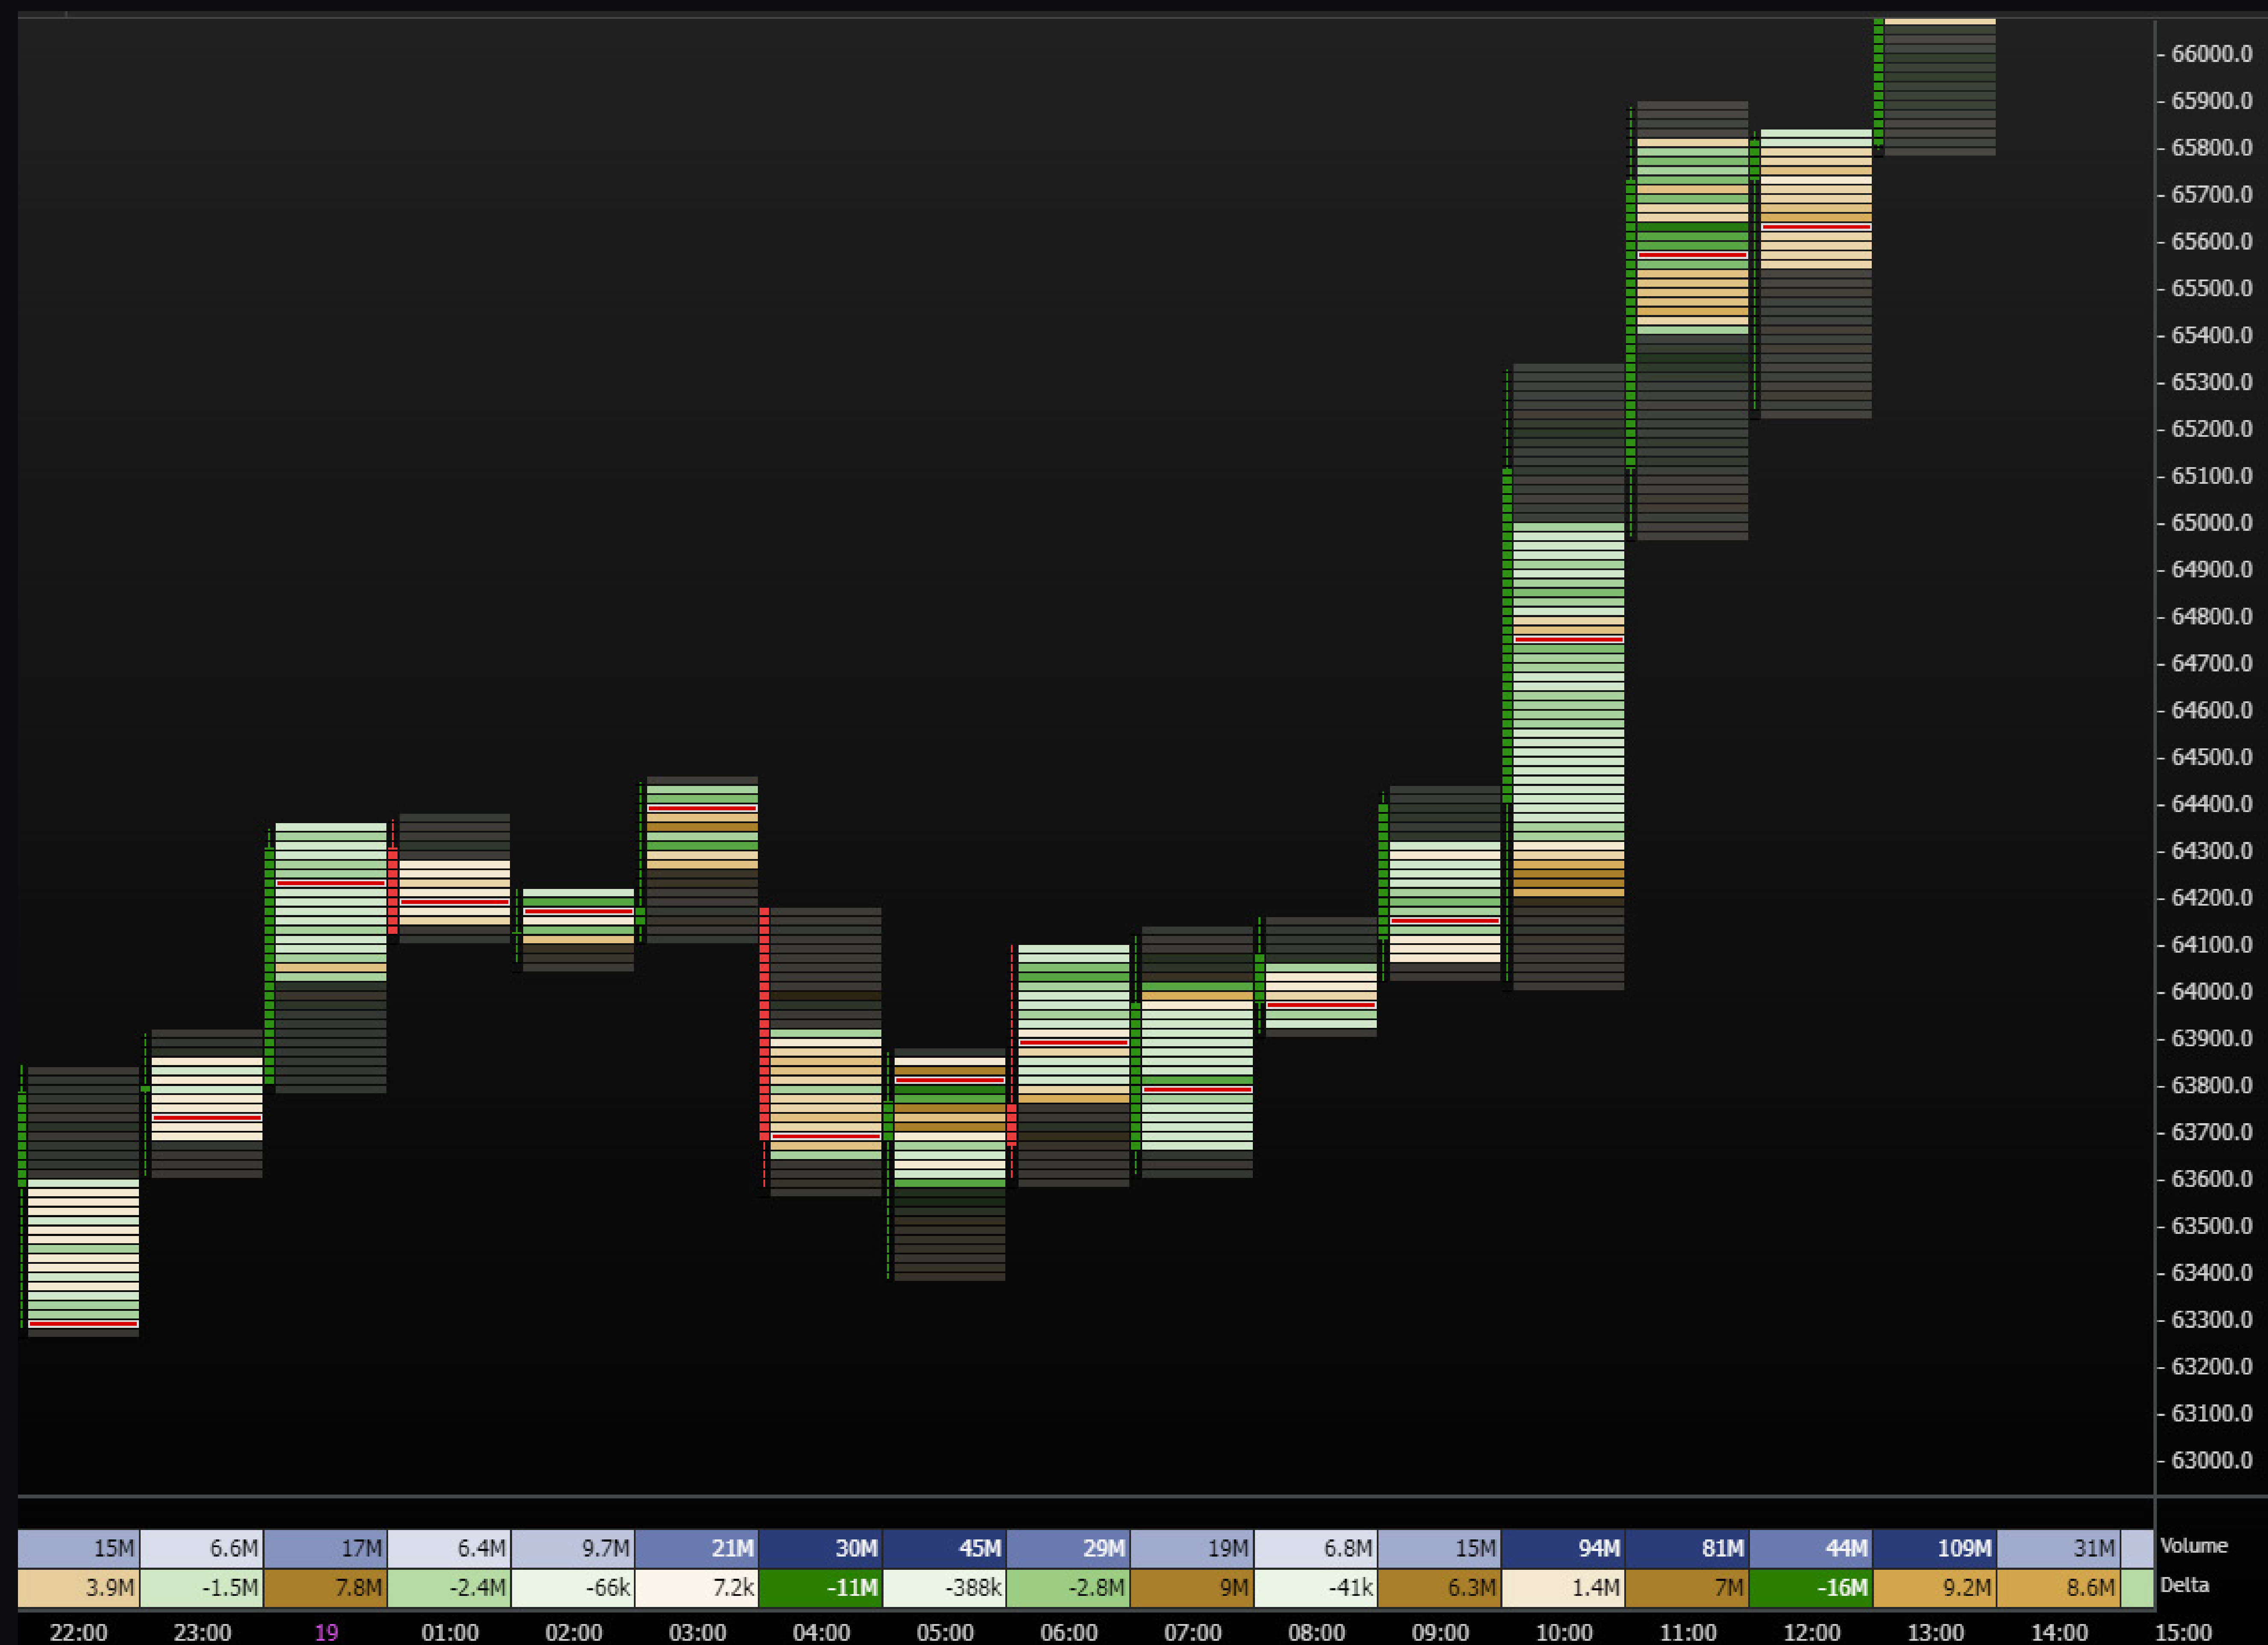

Foorprints module: Delta (24:43)

Delta Breakouts

A healthy and strong breakout of a range is accompanied by strong Volume and increasing Delta.

In this example, we can see how the price breaks out of the range with high volume and a very positive delta

Foorprints module: Delta (34:27)

Delta Ranges

When trading a range, we can expect a decrease in Delta as the edges of the ranges are approached. This signal weakness and likely to remain range-bound.

Foorprints module: Delta (50:15)

Delta Absorption

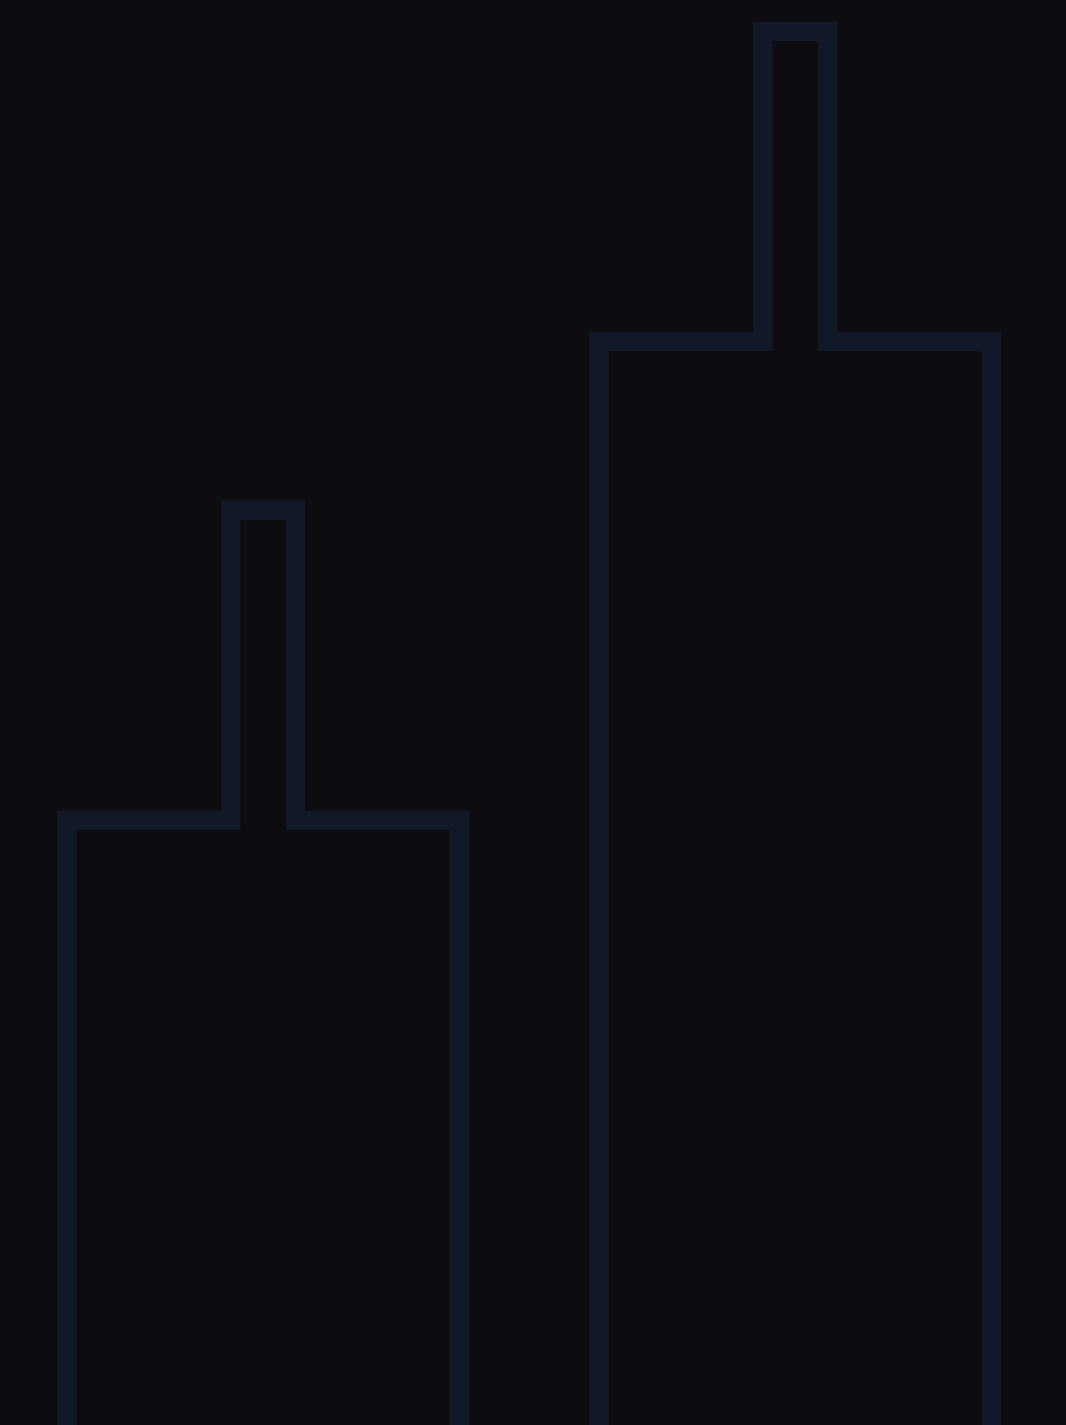

Green candle and negative delta

Red candle with positive delta

We can see a red candle with a positive delta and a green candle with a negative delta. In this case, the Delta is showing a sign of absorption. However, the best way to look for absorption would be using the Cumulative Volume Delta (CVD).

Foorprints module: Delta (50:15)
