Fibonacci Retracement

Always take your Fib retracements from left to right on a chart. When looking for resistance on the way back up you pull from the high on the left to the low on the right. When looking for support on the way down pull from the low on the left to the high on the right.

Also in 'Fibonacci' series in modules:

.382 and .618 CC Importance

If price closes below the .382 expect the to be hit. Here price bounces perfectly from the for a good 35% bounce, but when prices comes back into the level and closes below it was an early sign the uptrend was over and we were either entering extended consolidation, or a downtrend.

Uptrend begins and the .382 holds as support on retracements. Generally the .382 Fibonacci level will not be lost as support on the macro in a strong uptrend.

In a strong uptrend 0.382 should act as support, if lost CC (space between .618 and .66) should hold. If the CC is lost it's an early sign the trend is over, or price is in extended consolidation.

Champions Channel

The space between .618 and .66 on the Fibonacci retracement tool. Daniel generated this himself from the statistics he was building. 68% of the time the price went slightly through the .618 and bounced from the .66 thus he coined this Fibonacci zone the Champions Channel.

Fibonacci Confluence

To get some Fib confluence one has to pull at least two different Fibonacci pulls and search for those that line up. To find Fibonacci confluence you need to take at least 2 different Fibonacci pulls and then search for Fib levels that match up close together, thus creating a stronger Fib level.

EMA with Fib and Levels Confluence (Day Trading)

For example this is the last 12 hours of BTC trading. Price rejects from weekly level and price falls below the EMA, thus on next rise short the CC, stops above the high of that Fib pull. Each trade here has went perfectly so far (live data in a short now that is too trading for profit). Price also hovers around monthly level (to be used as another TA tool). If price is above EMA reverse and take longs on a retrace.

When price is below the 26 EMA you can look to short each bounce. If price is above EMA reverse and take longs on a retrace.

In this example price rejects from weekly level and falls below the 26 EMA, thus on next rise short the CC stops above the high of that Fib pull.

When price is below the EMA (26) you can look to short each bounce.

Negative Fibonacci Levels

These levels add another level of confluence for entries and targets. They are used for the moves that go external from the Fib pull range.

Explained in Contenders Fibonacci Part 2 – Negative Fibs stream on 6. 11. 2019 (27:00)

Negative Fibonacci Levels

Once we have points 1 and 2 on the chart we would be expecting an internal retracement to form point 3, which here tops out at the .5 internal Fibonacci level.

Once we have these 3 points and see that the internal Fibonacci level has held as resistance, one can use the external negative Fibonacci levels for targets on the short, or levels to see support and open a long (Must have more confluence)!

When we have three internal Fib points on the chart and the third point acts as resistance and we expect a retrace from it we can use negative Fib levels to find a potential target.

Explained in Contenders Fibonacci Part 2 – Negative Fibs stream on 6. 11. 2019 (32:42)

Negative Fibonacci Levels

Negative Fibonacci pulls are used to find entries and/or targets from an internal retracement. The negative with another technical tool to verify the target/entry.

As you can see here the -0.236 is where support was found to get a bounce underway.

The negative levels I use are -0.236 -0.618 -1 and -1.618

The negative Fib level can be used as a target from taking a short or as a level of support to open a long. There must of course be some confluence.

Fibonacci Expansion

When price goes from low to high and then breaks the previous low we can look for potential targets below with Fib Expansion tool.

Levels can be used for TP if you were shorting or potential entries for longs (confluence). This tool is used for harmonic targets also.

Explained in Contenders Fibonacci Part 3 – Fib Expansion stream on 13. 11. 2019 (25:41)

Fibonacci Expansion

When price goes from high to low and then breaks the previous high we can look for potential targets above with Fib Expansion tool.

Levels can be used for TP if you were longing or potential entries for shorts (confluence). This tool is used for harmonic targets also.

After drawing a Fibonacci retracement from pivots 1 to 2 if price goes external to the pull pivots you can look at the Fibonacci Expansion levels for entries or targets.

Explained in Contenders Fibonacci Part 3 – Fib Expansion stream on 13. 11. 2019 (33:23)

Fibonacci Expansion

Fib expansion is used for moves that go external from the standard Fib pull range. It is very useful when assets are reaching ATHs or ATLs. To get potential targets pull the fib from the last swing low to high.

When a stock hits all time low the Fibonacci expansion from the last swing low to high is a good way of generating targets for where the move down can find support. Here in this example the asset finds support at the 1.133 and in 1 day bounces 35% straight to the opposite 1.133 Fibonacci expansion.

CCW Setup

This is a truly amazing tool to completely remove emotions with entering setups, taking profits and setting stop losses. It is highly recommended for beginners as it makes trading easier. It can be used on anytime frame and also, context is important.

Explained in Contenders CCW stream on 19. 2. 2020 (26:28)

Fibonacci Time

Time is very important. You can use TA to workout the direction but if you don't know the correct time to enter you can be right in your analysis but wrong in timing. So, Fib time adds a little bit of magic to your trading as it helps you 'predict' when the correction/ impulsive move may end. 1-1.

Here we take the time from the very low of the impulsive move to the high of the impulsive move and we can see two majorly important Time expansions has positive results on price. Firstly the 0.618 Time extension was followed shortly by a 400% increase in price and then the 1-1 Time extension was followed by a 250% increase.

You do not want to blindly trade off Fibonacci Time alone but use it as a confluence. \$7400 for the first bounce and 0.618 has great technical confluence along with 7500 at the 1-1.

Explained in Contenders Fibonacci Time stream on 29. 1. 2020 (23:41)

Fibonacci Time

This is an example of Fib time from the start of the 2011 bull run to the end of it in 2013 on BTC.

Explained in Contenders Fibonacci Time stream on 29. 1. 2020 (33:10)

- The 0.618 marks the end of the 2014 bear market.
- The 1-1 start of the 2016-18 bu
- The 2-1 end of bull market start of 2018 bear market.
- The 2.618 start of 2019 bull market.
- The 3-1 so far caused a major pivot to give a 25% increase in price.
