

Footprint Charts

Cheat Sheet

www.chartchampions.com

A Footprint Chart provides detailed information about the volume and order flow within the candle. Combining price, volume and order flow we can see the price movements and the volume transacted at each price level.

We can look inside a candle and see where there are many buyers and sellers horizontally which is helpful to determine support and resistance levels. Only market orders are shown.

Introduction to Footprint Charts (19:30)

We can also determine acceptance above or below a key level with footprint charts. We need a Footprint software such as Exocharts, ATAS or Quantower

Data within the candle

Here we can see three different data within a candle: Volume, Bid/Ask, and Delta for each price level.

The Value Area is highlighted with a lighter colour range, indicating where 68% of the volume in the candle was transacted.

Introduction to Footprint Charts (19:30)

Volume: Total amount of contracts transacted for each price level

Bid/Ask: The total amount of sells (on the left) and buys (on the right) for each price level

Delta: The sum of market orders at each price level. If negative, the sells overwhelm the buys. If positive, the buys overwhelm the sells.

Delta

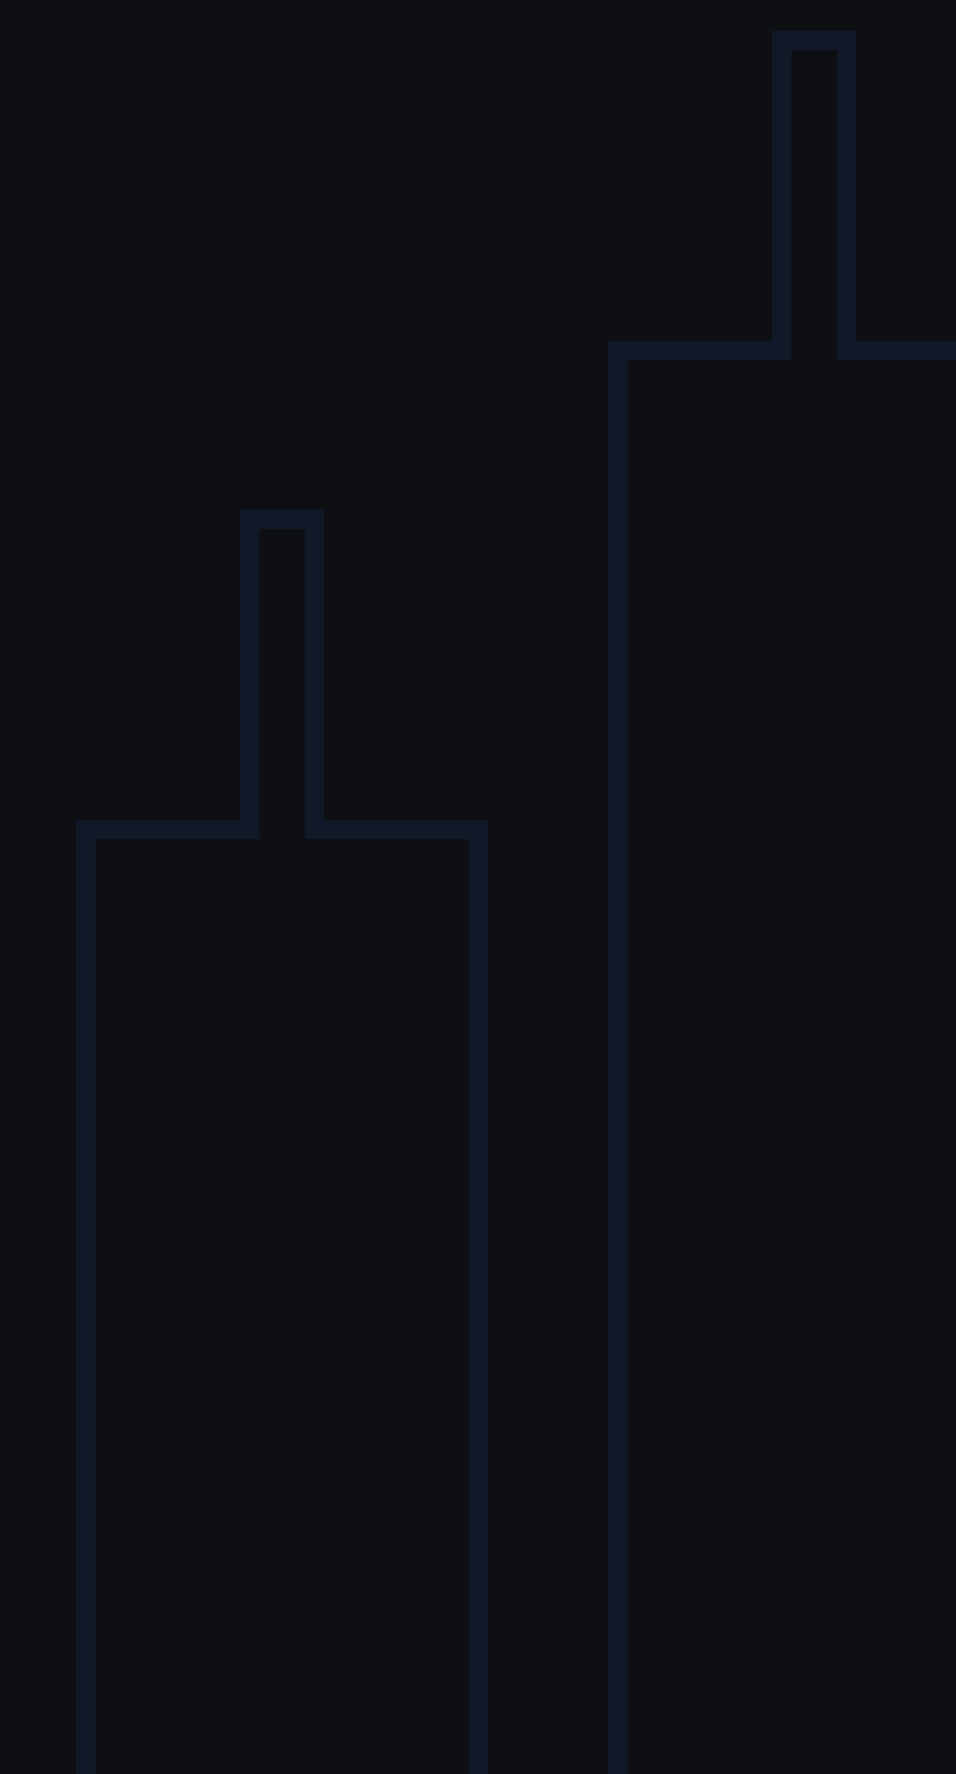

Bid and Ask Profile

Left side:
Contracts sold at market

Right side:
Contracts bought at market.

The Bid and Ask Profile is useful for day traders to see the live buying and selling activity when approaching a key level.

Introduction to Footprint Charts (30:15)

The general recipe for breakouts

When looking for a breakout of the range we want to see the following:

During a break to the upside:

- Volume increasing
- Point of control (POCs) higher on each candle
- Buy volume increases
- Positive Delta
- Bid and Ask profile full to the right

Introduction to Footprint Charts (43:10)

Acceptance above a key level is dependent on volume. When the price is above the range on low volume it is generally not accepted, people are not willing to trade at these levels and it has to come back to fair value.

When looking for a breakout of the range we want to see the following

Acceptance below a key level is dependent on volume. When the price is below the range on low volume it is generally not accepted, people are not willing to trade at these levels and it has to come back to fair value.

During a break to the downside:

- Volume increasing
- Point of Control (POCs) lower on each candle
- Sell volume increases
- Negative Delta
- Bid and Ask profile full to the left

Introduction to Footprint Charts (43:10)

Volume Clusters

We look at the Volume Clusters in a high time frame and look for the areas with darker colours.

Darker colours represent a high volume at that price level or area. Light colours mean low volume transacted.

Introduction to Footprint Charts (52:50)

We look for darkly shaded areas and when we find confluences around it presents a good trade opportunity.
